Editing & Transitions: After generating clips, you might need to do some light editing:

- **Cutting:** Trim the AI clips to the best parts. Often the start or end of generated videos might glitch – cutting those can hide imperfections.

- **Ordering:** Place your most exciting shot first (unless narrative strictly demands otherwise) to hook viewers. For example, if your sequence is a travel vlog, maybe start with a quick montage of locations (fast cuts or a sweeping pan) before the talking part.

- **Adding Manual Movement:** If your AI clips are static but high-quality, you can fake movement in post. Use zoom cuts or pan effects in a video editor (most mobile editing apps let you animate a slight zoom on a static image). This Ken Burns effect on photos keeps things from feeling static.

- **Transitions:** Quick cuts are standard on TikTok (to keep pace). But you can also prompt AI for transitional shots (like an AI-generated whip pan or a motion blur frame that could act as a bridge). Simpler: use built-in transitions (flash frames, spin effects) sparingly to add flair. AI can generate **transition frames** if asked – e.g. *"a radial blur transition frame, colors streaking in motion"* which you then sandwich between two clips to simulate a fast camera spin transition.
