- **Runway's Inpainting & Motion Tools:** Runway not only generates video, but also can do video **inpainting** and **motion tracking** of assets. If you need to, say, insert an AI-generated object into real footage (or vice versa), Runway's tools let you mask and replace elements over time. This goes beyond prompting, but is good to know as you advance – e.g., you have a real video of a street and you want a giant AI-generated monster to appear in it. You could generate the monster images and use Runway's video tools to composite it moving across frames. It's advanced, but the cheat sheet wouldn't be complete without hinting at these possibilities!

- **Narrative Movement (Story Flow):** Consider the "movement" of the story itself. A common approach for short videos:

    1. **Start static or with a slight movement** (to establish context), very briefly.

    2. **Introduce rapid movement or change** (to hook – e.g., person jumps into frame, camera zooms, etc.).

    3. **Alternate stable and dynamic moments** to give viewers a breather yet keep interest (e.g., a stable talking segment for 2 seconds, then a quick cut to a moving scene).

    4. **Build to a climax** – the most intense motion or scene near the 2/3 mark of the video.

    5. **End with a resolving movement** – maybe camera pulls back to reveal the conclusion or a final action (like character exits frame). Ending on a moving subject often feels more satisfying than a freeze.

- **Example (End-to-End):** Let's say you want to create a 15-second cooking Reel using AI:

    - **Shot 1 (Hook, 3s):** Overhead shot of ingredients on a table – suddenly the camera **zooms in** on an egg as it cracks open (generated via Sora or Runway). This is dynamic and intriguing.

    - **Shot 2 (Context, 4s):** Wide shot of a kitchen with a person cooking (could be a Midjourney image animated with Pika). Camera is relatively stable here, slight handheld sway, focusing on the action of stirring in a pan.

    - **Shot 3 (Close-up, 3s):** Close-up of the dish sizzling in the pan – maybe an AI-generated slow-motion of vegetables tossing (Runway Gen-2 with text "slow motion of vegetables being tossed in a wok, oil sizzling, camera static") for a satisfying detail.

    - **Shot 4 (Reveal, 3s):** Final plated dish – camera **pans around** the plate for a glamour shot (could use an image of the dish and animate a pan). End with that movement.

    - **Edit & Polish:** Add a quick crossfade or whip transition between shots if needed, add music or voiceover. The result: an AI-crafted cooking video that feels lively and coherent.
