Always preview your videos before posting. Sometimes AI videos can have artifacts (strange warping, etc.). A quick edit or even adding **captions or graphics** on top can mask those. Captions, besides hiding flaws, also add engagement (many people watch muted, so on-screen text keeps them hooked). You might prompt ChatGPT to even suggest *"animated text for the intro"* or a *"call-to-action graphic"* for the end (though you'd create those with a design tool or simple editor).

By using these cheat sheets, you can generate an entire flow: ChatGPT gives you the story and script, image AIs give you visuals and clips, and movement prompts plus some editing tie it all together. The result? Scroll-stopping TikToks/Reels that combine the power of storytelling with eye-catching AI-generated visuals and motion. Happy creating, and remember to keep experimenting – the AI tools are evolving fast, and so will your creative process
