Movement Prompt Templates: Here are some prompt patterns you can copy/adapt for dynamic video creation:

- *Establishing Shot + Pan: "A **wide establishing shot** of [scene]. Camera starts stationary, then **pans** slowly to the right, revealing [key element]. Golden hour lighting, cinematic style."* – Use this to set context at the start of your video. The slow pan adds elegance and professionalism.

- *Dolly/Zoom (Push or Pull): "Camera **dollies in** towards [subject] for a close-up, starting from a medium shot. As the camera moves, background blurs (depth of field) focusing attention on [subject]."* – Great for transitioning from environment to character.

- *First-Person Motion: "GoPro-style first-person view: the camera **sprints forward** through [environment], with head-bob motion."* – Use for immersive action (running, driving, etc.). The AI will add motion blur and shake to simulate the POV.

- *Orbit Shot: "The camera **orbits 360° around** [subject] over 5 seconds, keeping them centered while the background changes."* – This is a dramatic effect (think "Matrix" spin). Harder for AI to get perfect, but you can attempt it or do 180° half-orbits for a similar feel.

- *Time-lapse Effect: "A stationary camera angle showing [scene]. **People and clouds move rapidly** (time-lapse effect) as day turns to night in 10 seconds."* – AI might interpret this as an accelerated motion. Some video generators might actually handle the scene change (otherwise, could stitch frames from different times). It can be a cool transition piece.
