✅ GUIDE TO USING MIDJOURNEY PARAMETERS (STEP-BY-STEP)

To apply parameters in MidJourney:

1. Begin with your main prompt describing the subject.
2. Add any parameters at the end to adjust aspects like style, size, or quality.
3. Paste the entire prompt into the MidJourney prompt box (via Discord or the /create tool).
4. Parameters should be separated by spaces, **not commas**.

---

1. Aspect Ratio (--ar)

Adjusts the image's width-to-height ratio.
Examples:

- `--ar 1:1` → square
- `--ar 16:9` → horizontal, cinematic
- `--ar 9:16` → vertical, portrait

---

2. Style Reference (--sref)

Copies the style from a reference image.
Additional options:

- `--sw` → style weight (0–1000)
- `--sv` → style version (6 recommended)

Example:
```
--sref https://styleimage.jpg --sw 300 --sv 6
```

---

3. Character Reference (--oref)

Keeps a character consistent across multiple images.
Additional option:

- `--cw` → character weight (0–100)

Example:
`--oref https://characterimage.jpg --cw 80`

---

4. Stylization (--stylize or --s)

Controls creativity and artistic flair:

- Low (50–100) → realistic
- High (250–1000) → more artistic

Example:
`--stylize 300`

---

5. Quality (--quality or --q)

Determines detail level vs. speed:

- `--q .5` → faster, lower detail
- `--q 1` → default
- `--q 2` → slower, more detailed

Example:
`--q 2`

---

6. Seed (--seed)

Reproduces the same layout for consistency.

Example:
`--seed 42`

---

7. Chaos (--chaos or --c)

Adds unpredictability to results:

- `--chaos 0` → very consistent
- `--chaos 100` → highly random

Example:
`--chaos 80`

---

8. Weirdness (--weird or --w)

Makes images unusual or surreal.
Max: `--weird 3000`

Example:
`--weird 1000`

---

9. Style Raw (--style raw)

Disables MidJourney's automatic beautification for a more literal result.

Example:
`--style raw`

---

10. Draft Mode (--draft)

Generates quick, low-res images—ideal for testing ideas.

Example:
`--draft`

---

11. Tile Mode (--tile)

Creates seamless, repeatable textures.

Example:
`--tile`

---

12. Repeat (--repeat or --r)

Generates multiple images from the same prompt.

Example:
`--repeat 3`

---

13. Stop (--stop)

Ends generation early for a sketchy or dreamy effect.
Range: `--stop 10` to `--stop 100`

Example:
`--stop 30`

---

14. Image Weight (--iw)

Sets the influence of an input image.
Range: 0–3

Example:
`--iw 2`

---

15. Stealth / Public (--stealth, --public)

Choose whether your image appears in the community gallery.

Example:
`--stealth`

---

16. Speed Settings (--fast, --relax, --turbo)

Controls generation speed and GPU usage:

- `--fast` → quickest
- `--relax` → slower, no GPU cost
- `--turbo` → maximum speed

Example:
`--fast`

---

17. Niji Mode (--niji)

Switches to anime-style generation.

Example:
`--niji 6`

---

18. Draft → Enhance Workflow

1. Generate a draft using `--draft`.
2. After generation, click MidJourney's **enhance** button to refine the image.

Example:
`floating city concept --draft`
