MODULE 1.3

The Money and What's *Realistic*

Real numbers behind this business, why they are possible, and the honest line between what is reachable and what is not guaranteed.

MODULE 1.3

The Money and What's *Realistic*

Before we go deeper, it helps to ground this in real numbers, because the figures attached to this business can sound fake. You should understand both why they are possible and why they are not guaranteed.

The margin

The basic money was shown back in Module 1.1. You sell at your price, you pay the supplier their lower cost, and you keep the difference. In practice, well-run stores in this model often run margins around **70%**. The reason the margin can be that high is that you have almost no overhead. You are not paying for ads, you are not holding inventory, and your content costs almost nothing to make once you have the skill. The customer's payment, minus what the supplier charges to fulfill it, is mostly yours.

That 70% number is a good anchor. It means a store doing five thousand dollars a day in sales is keeping most of that as profit, not feeding it back into ad budgets the way a paid operator has to. **No ad spend** is one of the defining features of this model, and it is a big part of why the profit numbers look the way they do.

~70%	$0	$0
TYPICAL MARGIN	AD SPEND	INVENTORY COST

What "converts per million views" means

You are going to hear the phrase **"converts per million views"** all the time, and it is worth understanding, because it is the real unit of measurement in organic. Since you do not pay for reach, your sales come down to how many views you get and how well those views turn into purchases. So we measure a product by how much revenue it makes per million views.

A strong product, usually a problem-solving or value product with real demand, might make around **twenty thousand dollars in sales per million views**. A weak product, even one that goes viral, might make a small fraction of that. This is why the type of product matters so much, and why later sections separate products that go viral but do not sell from products that both spread and convert.

imarketing.courses

THE REAL UNIT OF MEASUREMENT

Views by themselves are not the goal. **Views that convert** are the goal. A viral video on the wrong product can earn almost nothing. The right product at a fraction of the views can do many times more.

What's realistic, and what isn't

The honest version of this business is that when it works, it can make serious money fast, and the results come from skill and systems rather than luck. Both halves of that matter.

On the upside, this is what we are actually hitting. We are running AI organic marketing on our own stores, taking brand new products from zero to thousands of dollars a day, and putting up **five-figure days** with weekly revenue well beyond that. All organic, all AI, no ad spend. **Those numbers are not industry rumors, they are our results.** When a product hits and the system is in place, this model can scale faster than almost anything else in e-commerce, because there is no ad budget acting as a ceiling and no inventory slowing you down.

On the other side, what makes this last is treating it as a **repeatable system** instead of chasing a single lucky hit. Finding one product, riding it, and having nothing to fall back on when the content stops working is not the goal. **Building something repeatable is.** The difference between a business that keeps producing and one that fades after one win is almost entirely whether the system is in place. That is important enough that a whole later section is built around it.

The honest expectation

The realistic ceiling

Genuinely high. AI has made the path to it shorter than it has ever been. No ad budget acting as a ceiling, no inventory slowing scale, and a margin that gets to stay in your pocket.

The catch

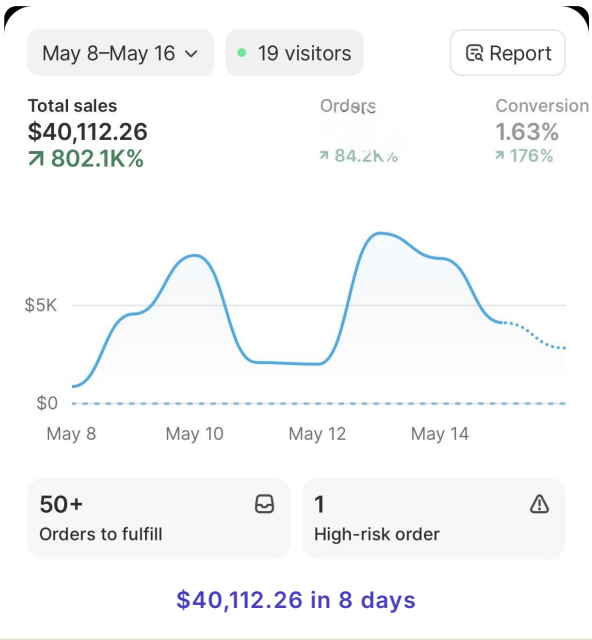

The results come from skill and systems, not luck. **What lasts is building a repeatable engine.** What does not last is chasing a single lucky hit with nothing behind it.

Go through the rest of this course with that in mind. You are not learning how to get one viral video. You are learning how to build a repeatable engine that produces hits and turns them into a real business.

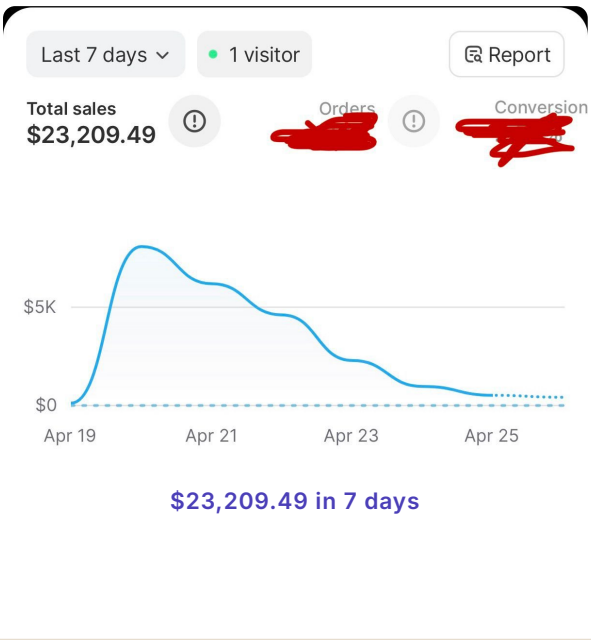

imarketing.courses

What this looks like in practice

These are **real Shopify screenshots**. Different products, different days. The point is that the numbers in this module are not made up, and they are not industry rumors. **These are the kind of numbers we are actually hitting with AI organic marketing on brand new products we are finding with the burner method and bringing to market.** Completely realistic for you to hit if you put in the work.

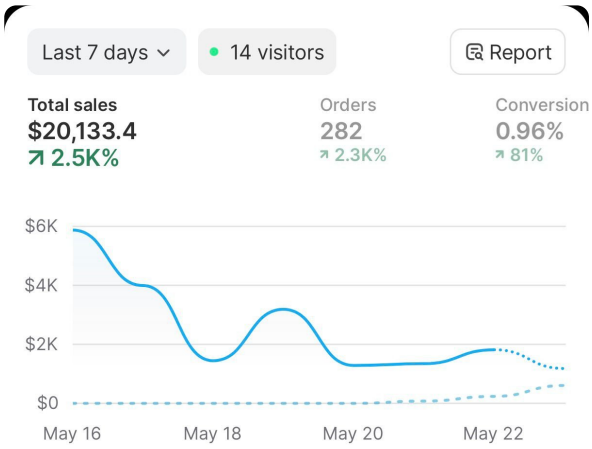

$40,112.26 in 8 days

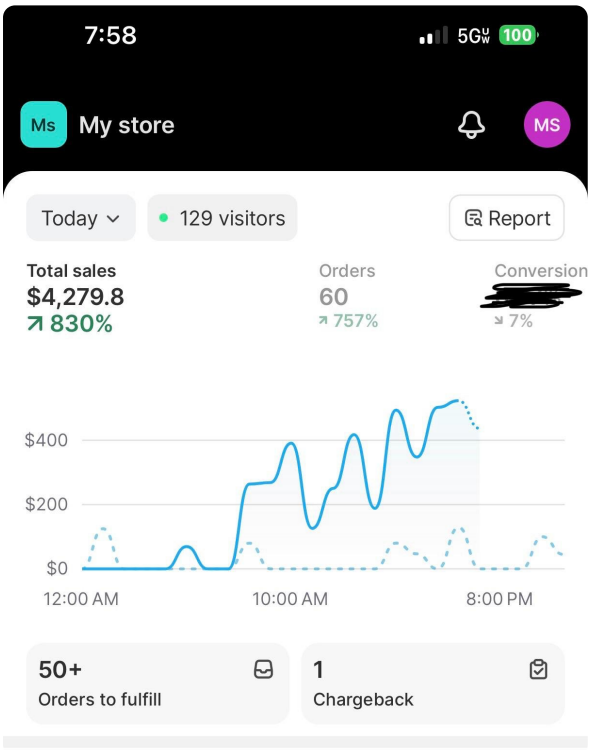

$23,209.49 in 7 days

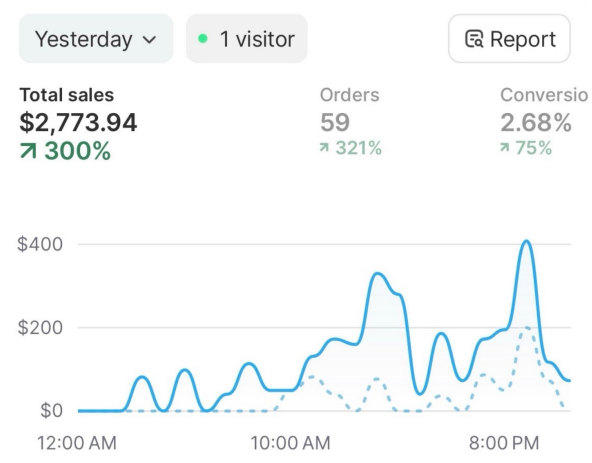

imarketing.courses

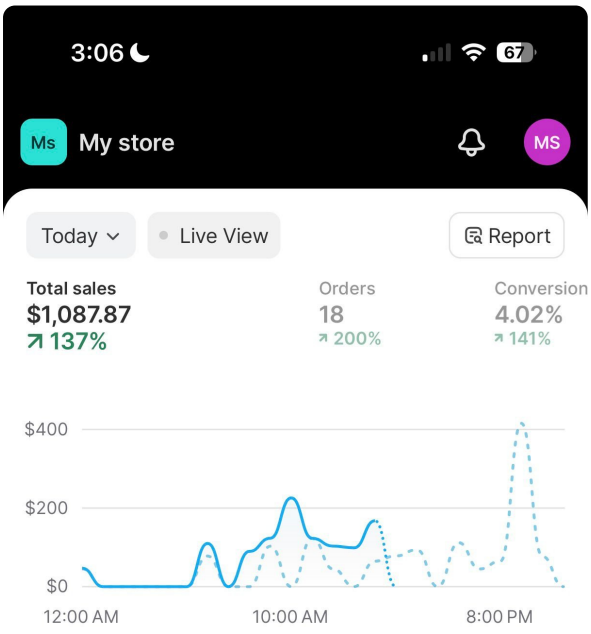

$20,133.40 in 7 days

$4,279.80 in a single day

$2,773.94 in a day

$1,087.87 in a single day

These are the kind of numbers we are actually hitting. They are not some made-up flex. They are completely realistic if you put in the work, follow the system, and understand what you are doing. There have been much, much bigger days and months than these in this space.
