

VIDEO ANALYSIS & SCRIPT EXTRACTION

What You're Building

This section shows you how to create a specialized AI tool that breaks down successful UGC videos and outputs ready to use prompts. You're programming an assistant with one purpose: converting proven winners into assets you can replicate.

Deconstructing Winning UGC: Your Custom AI System

Why Build a Custom Gem?

Generic chatbots give generic results. Gemini is one of the best AI tools that can analyze videos and extract the scripts! This is your unfair advantage.

A key advantage of using AI-generated video is the ability to maintain true visual consistency in your "creators."

Generic Chatbot vs. UGC ANALYZER Gem

Feature	Generic Chatbot	UGC ANALYZER Gem
Goal	General conversation	Production-ready prompt
Video Analysis	Basic summary	Detailed technical breakdown
Output Format	Varies	Strict Video-optimized template
Accuracy	Guesswork	Based on proven UGC analysis

The Creation Process

To create your specialized tool, follow these steps:

01

Open Gemini's "Create a Gem" Interface

02

Paste the Master-Prompt in the Instructions field

Use the prompt from the **UGC ANALYZER GEMINI GEM** document.

03

Upload Knowledge Base

Under "Knowledge," upload this file:

- **FILE 1**

04

Name and Save

Name your Gem: "UGC Analyzer" or whatever you prefer.

What Consistency Actually Means: The Virtual Brand Ambassador

A key advantage of using AI-generated video is the ability to maintain **true visual consistency** in your "creators."

It's not just about a "woman in her 20s with brown hair." True consistency means detailing every nuance of a digital persona:

Eye Details

Same eye shape, color, and spacing

Nose Structure

Same nose structure and proportions

Facial Contours

Same jawline and face shape

Lip & Mouth

Same lip fullness and mouth width

Skin Tone & Texture

Same skin tone and texture

Subtle Features

Same subtle features (freckles, eye shape, smile lines)

When you nail this level of detail, you can generate 50 videos with the same "creator" and less than 1% of the audience will ever know they are not real.

How to Create Consistent Characters with Sora 2

The Character Cameo Feature

Sora 2 has a powerful feature that allows you to create a character cameo of any character you generate, ensuring perfect consistency across unlimited videos.

The Character Cameo Process

01

Generate Your Base Character

Generate a video of your character standing/talking on a white background in Sora

02

Create Character Cameo

Hit the 3 dots → select "Create Character"

03

Trim to Length

Trim to the exact length you want

04

Save as Reusable Cameo

Your character is now saved and ready to use

The ROI of Consistent Characters

Understanding the impact of character consistency on your brand's return on investment.

Inconsistent Characters:	Consistent Characters:
Different faces each time	Familiar, repeatable persona
Unclear brand identity	Builds recognition and trust
No audience recognition	Creates virtual brand ambassador
Each video stands alone	Compounds value over time

By leveraging consistent characters, you don't just create content, you cultivate a **virtual brand ambassador** that can build trust and recognition for your product or message.

The Deconstruction Workflow

The Process (Dead Simple)

1. Open your "UGC ANALYZER" Gem.
2. Upload a winning reference video from your swipe file.
3. Use this prompt: "analyze this video in depth and make it into a sora 2 prompt using all the knowledge you have"

What You Get Back:

The Analysis:

- Full script transcription
- Camework breakdown
- Lighting analysis
- Performance deconstruction

The Prompt:

- Copy-paste-ready Sora prompt
- Engineered for high-fidelity replication
- Production-optimized formatting

Hook Extraction & Iteration

The Strategy:

The hook is everything. Your Gem gives you the winning hook blueprint. Your job: **iterate on the formula, not copy it.**

The competitive advantage is that you're testing ten variations of a proven winner.

Here is an example of iterating on a Problem-Solution Lead hook:

Iteration Type	Example Hook
Original Hook	"I used to hide my acne with makeup every single day"
Variation 1	"Spent hundreds on products that made my skin worse"
Variation 2	"Too embarrassed to leave the house without foundation"
Variation 3	"Two weeks ago my skin was a disaster, look at it now"
Variation 4	"Miss this and you'll pay double next week"
Variation 5	"We're closing applications tonight, last chance"
Variation 6	"Don't be the person who sees this and waits too long"
Variation 7	"Started with 500, down to 23 in two days"
Variation 8	"This is your last email about this offer"
Variation 9	"Sale ends Sunday 11:59 PM, then it's gone"
Variation 10	"We're not doing this promotion again this year"

Your advantage is running multiple angles on structures that already convert.

Building Your Prompt & Script Library

What to Save

Every time your Gem deconstructs a winning video, save the assets:

Asset 1: The High-Fidelity Sora Prompt

- Save the entire prompt.
- **Naming convention:** Character-Setting-Type-Prompt.txt
- **Example:** Rachel-Kitchen-Testimonial-Prompt.txt
- Save the reference video also.

The Power of Your Library

After 20 deconstructions, you will have:

- 20 proven prompt templates
- 20 production-ready scripts
- A reusable weapon arsenal

When a client needs a campaign:

1. Don't start from scratch.
2. Pull a template.
3. Adapt it.
4. Launch 20 variations in an afternoon.

This is how you build an assembly line for printing money.
