

COMPLETE VEO 3.1 AI UGC Guide

Understanding Veo 3 vs Sora 2

When to Use Each Model

Both tools have distinct strengths. Understanding the tradeoffs helps you pick the right one for each situation.

Sora 2 Strengths:

- More realistic output quality
- Better script execution
- Superior voice tone and acting
- Higher production value when properly prompted

Veo 3 Strengths:

- Faster generation speed
- More reliable outputs
- Better for rapid concept testing
- Ideal for quick iterations
- Faster turnaround for client work

The tradeoff: You sacrifice some quality with Veo 3, but gain speed and reliability. For rapid content creation, testing multiple concepts, or working with tight deadlines, Veo 3 is the better choice.

Use Cases for Veo 3

Best for:

- Quick UGC clips
- Fast product showcases
- Rapid iteration on concepts
- Client work with fast turnarounds
- Testing multiple angles quickly
- B-roll and supplementary footage
- Unboxing videos

Not ideal for:

- Hero content requiring maximum realism
- Long form storytelling
- Content where acting quality is critical

The Veo 3 Prompting System

The Snubroot Meta Framework

Someone named Snubroot created a comprehensive meta prompting framework for Veo 3 on GitHub. This framework breaks down every detail of how to prompt Veo 3 for optimal results.

Access the framework: https://github.com/snubroot/Veo-3-Meta-Framework

What the framework covers:

Cognitive Layers:

- Identity layer
- Knowledge layer
- Analysis layer
- Generation layer
- Quality layer
- Output specifications

Technical Details:

- Consistency rates
- What works and what doesn't
- Effective dialogue techniques
- Advanced movement controls
- Physics parameters

This is extremely detailed. The best approach is to inject the entire framework into Claude so it can generate properly formatted prompts for you.

Setting Up Your Claude Prompting System

Creating Your Veo 3 Project

01

Create New Claude Project

Name it something like: "Veo 3 Snubroot: Create High Quality Veo 3 Prompts"

02

Add Instructions

In the instructions field, write: "Your role is to create me high quality AI UGC Veo 3 prompts"

Save the instruction.

03

Add Knowledge Base

Copy the entire Snubroot framework (Control A, Control C from the GitHub page) and paste it into your project knowledge files.

Alternatively, download the GitHub content as a PDF and upload that.

Name the file: "Veo 3 Prompting Guide"

> **Why this setup works:** Claude now has complete context on Veo 3's capabilities and requirements. You don't need to learn the technical details yourself. Just describe what you want and Claude handles the proper formatting.

Creating Your Starting Frame with Nano Banana Pro

Before generating video, you need a starting frame image.

Process:

1. Use Nano Banana Pro to create your product image
2. Generate a person holding or interacting with your product
3. Ensure the image shows the exact scenario you want to animate

Example: Create an image of someone holding your Goli gummies jar at chest level, looking at camera.

This starting frame becomes the foundation for your video generation.

Generating Veo 3 Prompts with Claude

The Simple Workflow

Once you have your starting frame image:

1. Open your Veo 3 Claude project
2. Upload your Nano Banana Pro generated image
3. Describe what you want in plain language

Example prompt to Claude: "Create me an 8 second Veo 3 prompt for my UGC video of my Goli gummies"

What Claude returns:

A perfectly formatted Veo 3 prompt containing:

- Subject description
- Action specifications
- Scene details
- Style parameters
- Dialogue script
- Sound design notes

Everything formatted exactly how Veo 3 needs it.

Generating Videos in Veo 3

Platform: Flow.google

Flow is Google's filming and video generation platform. It supports all Google creative tools including Veo and Nano Banana.

Access: flow.google

Veo 3 Model Selection

Available options:

- Veo 2 (don't use)
- Veo 3.1 Fast (recommended)
- Veo 3.1 Quality
- Veo 3.1 Fast Lower Priority

Recommendation: Use Veo 3.1 Fast

Testing shows minimal quality difference between Fast and Quality modes, but Fast uses significantly fewer credits. Unless you need absolute maximum quality, stick with Fast.

Subscription Tiers

Free Tier:

- Basic access to Veo 3
- Limited credits

Pro Plan (Recommended):

- Access to full Google AI ecosystem
- Better credit allocation
- Integration with other Google tools
- Best value for most users

Ultra Plan:

- Approximately 25,000 to 28,000 credits
- For heavy users

Start with Pro. It provides enough credits for serious work while giving access to the full toolset.

Three Generation Methods in Flow

Method 1: Frames to Video (Primary Method for UGC)

What it does: Converts your uploaded starting frame into video.

Why use it:

- Maximum consistency
- Most control over output
- Predictable results
- Best for standard UGC

Process:

1. Select Frames to Video
2. Upload your Nano Banana Pro image
3. Paste your Claude generated prompt
4. Generate (create 2 versions for options)

This is your main method for AI UGC creation.

Method 2: Text to Video (Not Recommended)

What it does: Generates video from text description only.

Why avoid it: Unpredictable outputs. No control over starting appearance. Inconsistent results.

Skip this for UGC work.

Method 3: Ingredients to Video (Specific Use Cases)

What it does: Uses your product as an "ingredient" but doesn't require it in the starting frame.

When to use it:

- Unboxing videos
- Product reveals
- Scenarios where product appears mid-video
- B-roll where product enters frame

Example use case: Unboxing

You can't create a starting frame of someone pulling something out of a box because the product isn't visible yet.

Process:

1. Select Ingredients to Video
2. Upload your product image as the ingredient
3. Prompt: "Create me an unboxing video of someone pulling this product out of a box"
4. Generate

The model will create the unboxing motion and insert your product when it's revealed.

Example output: Person opens box, reaches in, pulls out your Yerba Magic product. Product stays visually consistent even though it wasn't in the starting frame.

Critical: The 8 Second Audio Limit

Understanding Veo 3's Constraint

Veo 3 only generates 8 seconds of audio maximum.

Why this matters:

If your dialogue script is longer than 8 seconds:

- Audio will cut off mid-sentence
- Speaker will talk unnaturally fast
- Video quality degrades

> **Solution:** When using the Snubroot framework through Claude, it automatically creates dialogue that fits within 8 seconds. The framework understands this limitation and adjusts accordingly.

Manual check: If writing your own scripts, time them. Keep dialogue under 8 seconds of natural speaking pace.

Complete Generation Workflow

Step by Step Process

Phase 1: Setup (One Time)

1. Access Snubroot framework on GitHub
2. Create Claude project for Veo 3
3. Add framework to Claude knowledge base
4. Set instructions for prompt creation

Phase 2: Image Creation

1. Generate starting frame with Nano Banana Pro
2. Ensure product is clearly visible
3. Get the exact framing you want for the video

Phase 3: Prompt Generation

1. Upload starting frame to Claude project
2. Describe your vision in plain language
3. Optional: attach your own script
4. Claude generates formatted Veo 3 prompt

Phase 4: Video Generation

1. Go to **flow.google**
2. Select Frames to Video (or Ingredients if needed)
3. Upload starting frame image
4. Paste Claude generated prompt
5. Choose Veo 3.1 Fast
6. Generate 2 versions for options

Phase 5: Review and Iterate

1. Check for dialogue timing
2. Verify product visibility
3. Assess overall quality
4. Regenerate with adjustments if needed

Advanced Techniques

Custom Scripts

You can provide your own dialogue scripts to Claude.

Process:

1. Upload starting frame
2. Attach your written script
3. Request: "Create Veo 3 prompt using this exact script"
4. Claude formats it with proper technical parameters

B-Roll Creation

Veo 3 excels at quick B-roll shots.

Use cases:

- Product close-ups
- Hand interactions
- Lifestyle context shots
- Transition footage

Generate these quickly without full UGC setup.

Rapid Concept Testing

The fast iteration advantage:

1. Generate concept A
2. Review in 2-3 minutes
3. Adjust prompt
4. Generate concept B
5. Compare both
6. Pick winner or iterate further

Do this 5-10 times in the time it takes Sora 2 to generate once.

Quality Optimization Tips

Getting the Best Results

Starting frame quality matters:

Higher quality Nano Banana Pro images produce better video outputs.

Lighting consistency:

Match your starting frame lighting to the scene you're creating.

Clear product visibility:

Make sure your product is prominent and well-lit in the starting frame.

Natural poses:

Avoid stiff, unnatural starting positions. They'll carry through to the video.

When to Upscale

If you need maximum quality from Veo 3:

1. Generate in Veo 3.1 Quality mode
2. Export the video
3. Upscale with external tools if needed

For most UGC applications, Veo 3.1 Fast quality is sufficient.

Veo 3 vs Sora 2: Decision Matrix

Choose Veo 3 when:

- Testing multiple concepts quickly
- Working with tight deadlines
- Creating B-roll or supplementary content
- Generating unboxing or reveal videos
- Budget requires credit efficiency
- Need reliable, predictable outputs

Choose Sora 2 when:

- Creating hero content
- Maximum realism is required
- Acting quality matters significantly
- Longer dialogue is needed
- Production value is the priority

> **Hybrid approach:** Use Veo 3 for rapid testing and concept validation. Once you identify winners, recreate them in Sora 2 for maximum quality final versions.

Workflow Summary

1. Set up Claude with Snubroot framework (one time)
2. Create starting frame with Nano Banana Pro
3. Upload to Claude with description of desired video
4. Get formatted Veo 3 prompt from Claude
5. Generate in **flow.google** using Frames to Video
6. Review, iterate, and deploy

This system lets you create UGC style videos in minutes instead of hours, perfect for high volume content needs or rapid concept testing.
