

# HOW TO CLONE ANY VIDEO

## (And Change the Person)

# Introduction

This workflow lets you take ANY ad and recreate it with your own custom AI character or swap the person in any viral TikTok with your own AI influencer. This process is wild in its simplicity and effectiveness.

# Tools You'll Need

We will primarily be using **Kling 2.6 Motion Control** paired with **Nano Banana**.

### Kling 2.6 Motion Control

The animation engine that brings your custom character to life with the exact movements from the original video.

### Nano Banana

The AI tool that swaps the person in your screenshot while maintaining the exact composition and positioning.

# The Full Workflow

The following is the step-by-step process for cloning a video and swapping the character.

# Step 1: Find a Winning Video

You can find winning videos to clone by:

- Checking ad libraries like Kalodata or Pipiads.
- Searching natively on TikTok or Instagram for the specific content you are looking for.

For example, if you need a try-on haul UGC video, someone talking about a specific product, or any short-form video in general, search for it on TikTok. This literally takes two minutes to find a quality reference.

# Step 2: Download the Video

Use a tool like **SnapTik** to download the TikTok video without any watermarks. This ensures you have a clean asset for the next steps.

# Step 3: Screenshot the First Frame

Once you have the video downloaded, take a screenshot of the very first frame. This starting frame is crucial—it acts as the foundation for the entire motion control process. If the foundation is off, the final animation will be crooked.

**Pro Tip:** The first frame is your foundation. Get this right, and everything else falls into place.

# Step 4: Change the Person Using Nano Banana

Put the screenshot from the previous step into Nano Banana.

**Critical Instruction:** Prompt it to change the person in the frame, but you **MUST keep the actual composition of the video the same.**

If you change the composition (layout or positioning), the motion control will mess up, and you will waste credits re-generating the image. You only want to swap the person: same pose, same angle, same everything just a different face and body or background.

# Step 5: Generate Your Starting Image

Once you have generated your desired character as the starting frame, you are ready for the final step. This is where you see your AI person come to life.

# Step 6: Animate with Kling 2.6

Put both the following assets into **Kling 2.6 Motion Control**:

- Your new starting image (from Nano Banana)
- The original video

Kling 2.6 will animate the video the exact same way as the original, but it replaces the character with your custom AI person. You get the same movements and the same energy, but with a different person. You can see some examples HERE

# Why This Actually Works

This workflow provides a massive advantage for marketers and creators:

### Accelerated Testing

You can test different angles and avatars without creating full new concepts from scratch.

### AI Influencers

You can spin up consistent AI influencers to use on short-form content, and people won't know they are AI.

### Content Synergy

You can pair this AI-generated video with AI slideshows for organic traffic.

### Traffic Driver

Use these cloned, high-performing creative assets to drive traffic to your offers or any client campaigns you are running.

> You are not reinventing the wheel; you are just changing who is in the driver's seat.
