

Creating Long Form Talking Head AI UGC with Sora 2 + Kling Motion Control

Overview of the Workflow

This method lets you create extended talking head videos (2+ minutes) using Sora 2 storyboard combined with Kling Motion Control for quality enhancement.

What you'll create:

- Long form AI UGC videos
- Consistent character throughout
- High quality output
- Professional talking head content

The process:

01

Plan your full video with Gemini and Claude

02

Break it into 25 second segments

03

Generate each segment in Sora 2 storyboard

04

Stitch together in CapCut

05

Enhance through Kling Motion Control

06

Final assembly in CapCut

Step 1: Planning Your Long Form Video

Work with Gemini and Claude

Determine video length:

- Decide total duration (2 minutes, 5 minutes, etc)
- Plan your content structure
- Write complete dialogue

Get organized:

- Have your full script ready
- Know your talking points
- Understand the flow of your content

Break Down the Video Structure

Once you have your full video planned, use Claude to structure it properly.

Prompt Claude: "Break up this long form video into 25 second segments, then divide each 25 second segment into five 5 second parts for Sora 2 storyboard"

What Claude will deliver:

Your video divided into 25 second chunks	Each 25 second chunk broken into five 5 second scenes	Ready to input into Sora 2 storyboard

Step 2: Generate Your Starting Frame

Before generating video, create your character starting frame.

Use Nano Banana Pro to generate:

- Your character's appearance
- The setting and background
- Initial pose and expression

> **Critical: You'll use this same starting frame for every segment.**

This ensures consistency throughout your entire long form video. The character stays identical across all segments.

Step 3: Generate First 25 Seconds in Sora 2 Storyboard

Set Up Sora 2 Storyboard

Use the same Sora 2 storyboard method covered in earlier modules.

Configuration:

- Five scene slots
- Each slot set to 5 seconds
- Total duration: 25 seconds

Input Your First Segment

For each of the five 5 second slots:

1. Paste the scene description from Claude
2. Set duration to 5 seconds
3. Verify timing adds up to 25 seconds total

Critical step: Attach your starting frame image

Upload your Nano Banana Pro starting frame to the storyboard. This reference image maintains character consistency.

Generate

Click generate and let Sora 2 create your first 25 seconds.

Step 4: Generate Remaining Segments

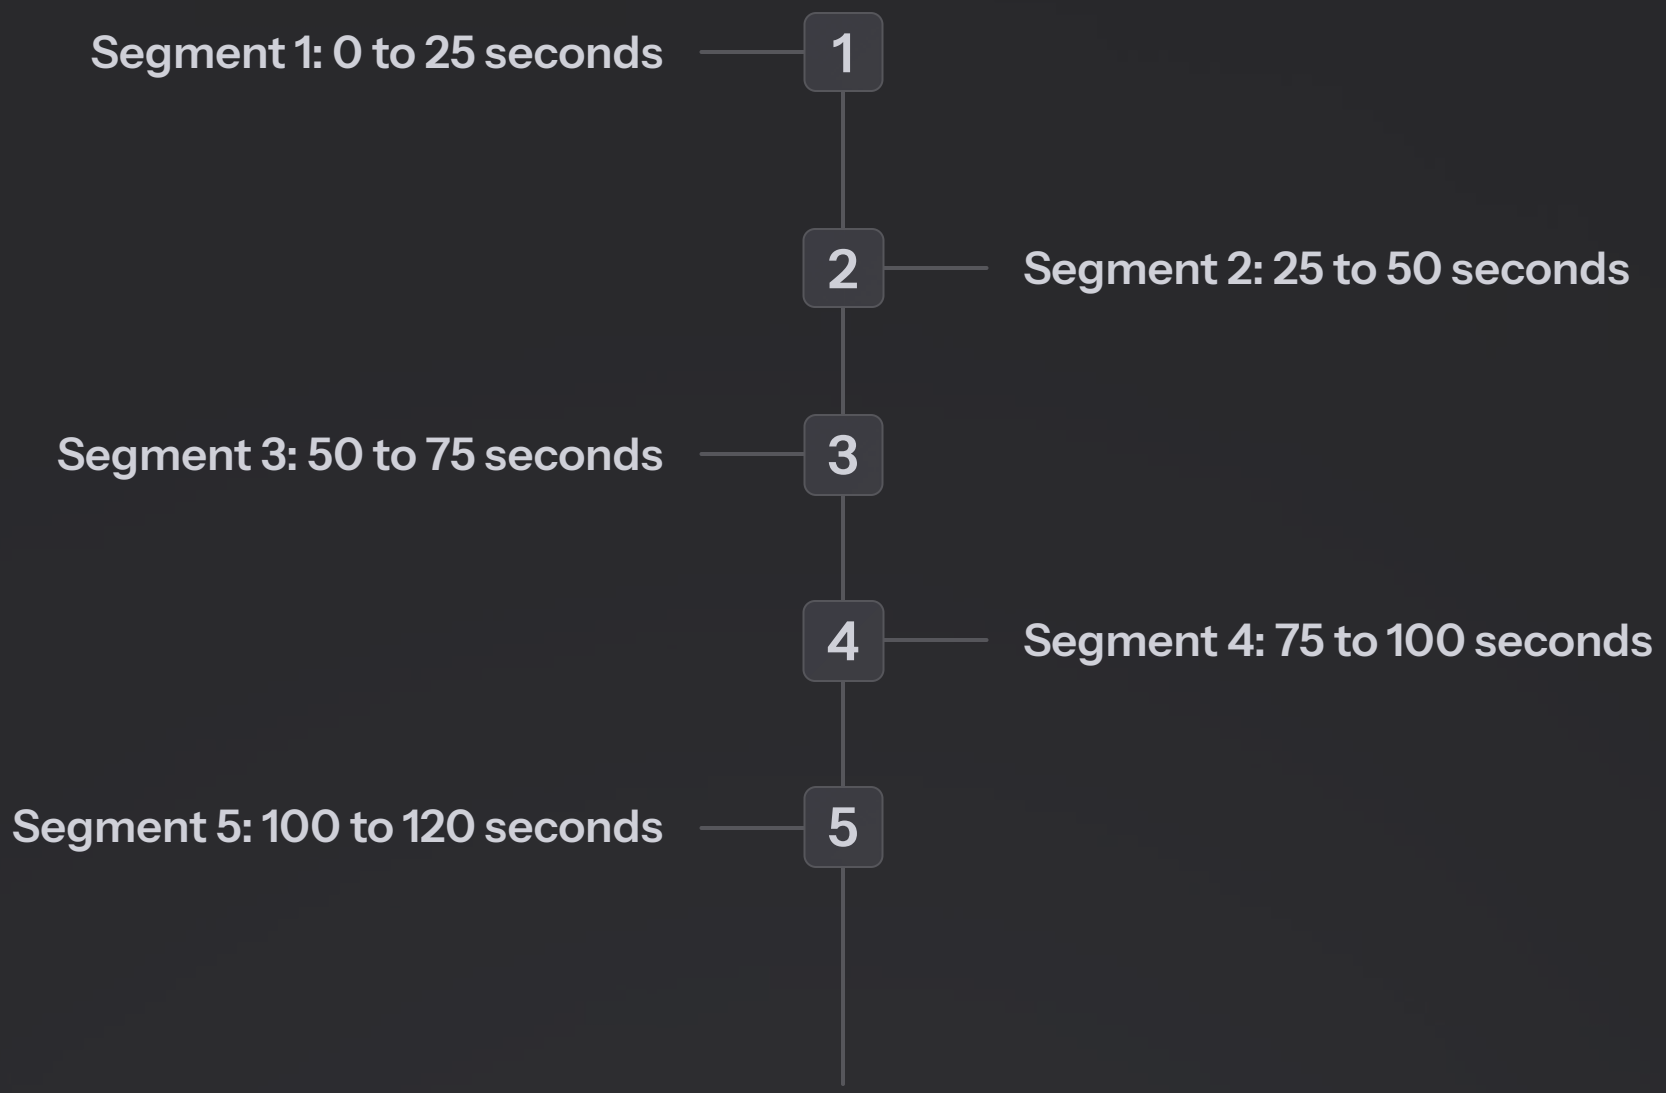

Repeat the Process

Once your first 25 seconds is complete:

1. Go back to Claude
2. Get the next 25 second segment (already broken into five 5 second parts)
3. Input into new Sora 2 storyboard
4. Attach the same starting frame image
5. Generate

Continue this pattern until you've generated your entire video.

Example for a 2 minute video:

Five total generations to complete the full 2 minutes.

Step 5: Stitch Together in CapCut

Initial Assembly

Once all segments are generated:

1. Open CapCut
2. Import all your Sora 2 segments
3. Place them in order on the timeline
4. Stitch them together into one complete video
5. Export the full stitched video

You now have your complete long form video, but it's in the stylized Sora 2 quality.

Step 6: Enhance with Kling Motion Control

Prepare for Motion Control

> **Important limitation: Kling Motion Control only accepts up to 30 seconds at a time.**

You need to break your stitched video into 30 second chunks.

Back in CapCut:

1. Take your full stitched video
2. Cut it into 30 second segments
3. Export each 30 second segment separately

Example for 2 minute video:

- Part 1: 0 to 30 seconds
- Part 2: 30 to 60 seconds
- Part 3: 60 to 90 seconds
- Part 4: 90 to 120 seconds

Four segments total.

Process Each Segment Through Kling Motion Control

For each 30 second segment:

01

Open Kling Motion Control

02

Upload your original Nano Banana Pro starting frame

03

Upload the 30 second video segment

04

Set to Standard Quality (not Professional)

05

Generate

Repeat for all segments.

This transfers the motion from your Sora 2 video to your high quality starting frame, removing the stylization and dramatically improving visual quality.

Step 7: Final Assembly

Stitch Enhanced Segments

Once all segments are processed through Kling Motion Control:

1. Import all enhanced segments back into CapCut
2. Place them in order on timeline
3. Stitch together seamlessly
4. Add any final touches (audio adjustments, transitions if needed)
5. Export final video

> You now have a **high quality, long form talking head AI UGC video** with consistent character appearance throughout.

Complete Workflow Summary

Phase 1: Planning

1. Use Gemini and Claude to plan full video
2. Write complete dialogue and structure
3. Have Claude break video into 25 second segments
4. Have Claude divide each segment into five 5 second parts

Phase 2: Starting Frame

1. Generate character starting frame with Nano Banana Pro
2. Save this image (you'll use it repeatedly)

Phase 3: Video Generation

1. Open Sora 2 storyboard
2. Input first five 5 second scenes
3. Attach starting frame
4. Generate 25 seconds
5. Repeat for each 25 second segment until complete

Phase 4: Initial Assembly

1. Import all segments to CapCut
2. Stitch together in order
3. Export complete video

Phase 5: Quality Enhancement

1. Cut stitched video into 30 second chunks
2. Process each chunk through Kling Motion Control with starting frame
3. Use Standard Quality setting

Phase 6: Final Assembly

1. Import all enhanced segments to CapCut
2. Stitch together
3. Final export

Why This Workflow Works

Consistency

Using the same starting frame for every segment ensures your character looks identical throughout the entire video.

Quality

Kling Motion Control transforms stylized Sora output into realistic, high quality video.

Length

By repeating the 25 second storyboard process, you can create videos of any length.

Control

You maintain complete control over dialogue, pacing, and visual consistency.

Important Reminders

Always attach the starting frame: This is critical for maintaining character consistency across all segments. Don't skip this step.

Use Standard Quality in Kling: Professional Quality actually makes videos look too enhanced and cartoonish. Stick with Standard.

Break into exact 30 second chunks for Kling: Kling Motion Control has a 30 second limit. Respect this limitation when cutting your video.

Be patient: This is a longer, more tedious workflow than using tools like InfiniteTalk. But it works when you want complete control using Sora 2 and Kling.

When to Use This Method

Best for:

- Maximum quality long form content
- When you want Sora 2's natural motion and expressions
- When you need complete creative control
- When you don't want to use specialized talking head tools

Consider alternatives when:

- You need faster turnaround
- The video is very long (10+ minutes)
- You're okay with tools like InfiniteTalk handling the process

> This workflow gives you **professional results** but requires more steps. The tradeoff is worth it when quality and control matter most.
