Using InfiniteTalk for Long Form AI UGC Videos

What Is InfiniteTalk?

InfiniteTalk is an open source model designed specifically for long form AI UGC videos and long form content requiring talking heads.

Access options:

1. Publicly online at InfiniteTalk's website (paid credits)
2. Via WAN2GP on open source (RunPod setup)

Two Ways to Use InfiniteTalk

Option 1: InfiniteTalk Website (Paid)

If you don't want to use WAN2GP or RunPod, you can purchase credits directly on InfiniteTalk's website.

Access: https://www.infinitetalk.net/?i=t3w4w

This option offers faster generation but at a higher price point.

Option 2: WAN2GP via RunPod (Open Source)

This guide focuses on using InfiniteTalk through WAN2GP with RunPod for cost effective open source access.

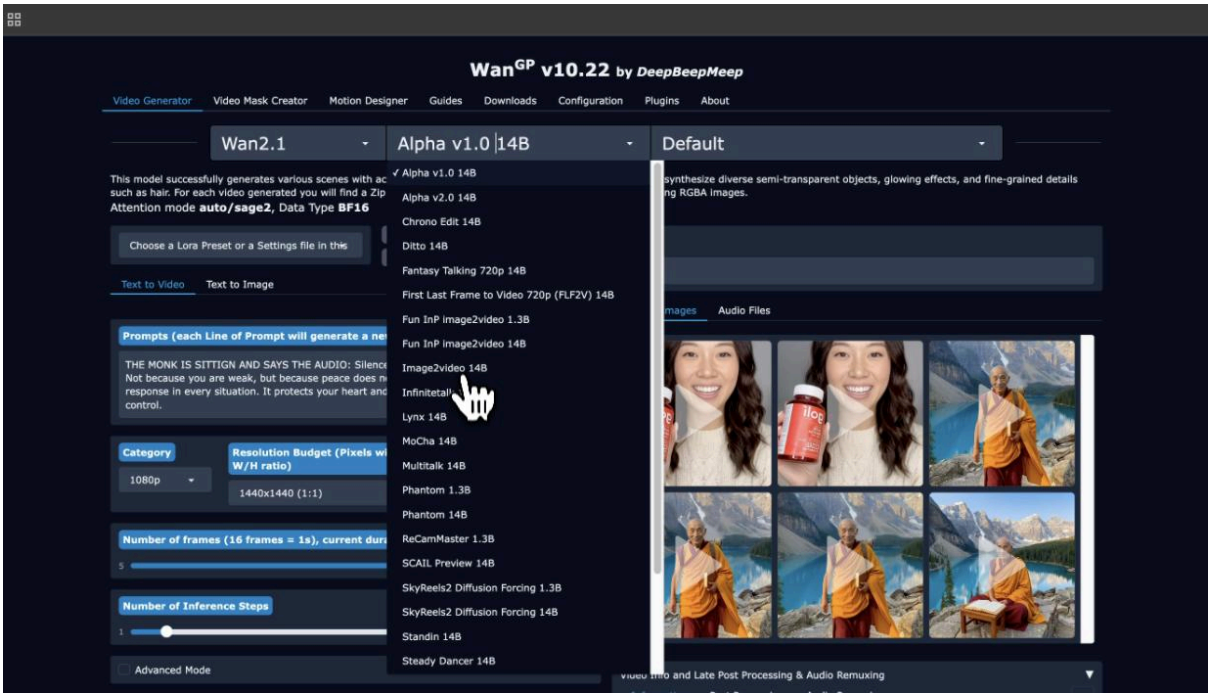

Setting Up InfiniteTalk in WAN2GP

Initial Configuration

Step 1: Select the Model

Once you load up RunPod and open WAN2GP:

1. Make sure Wan2.1 is selected in the main dropdown
2. Click the dropdown on the right side
3. Select InfiniteTalk

Step 2: Choose Speaker Mode

InfiniteTalk offers two modes:

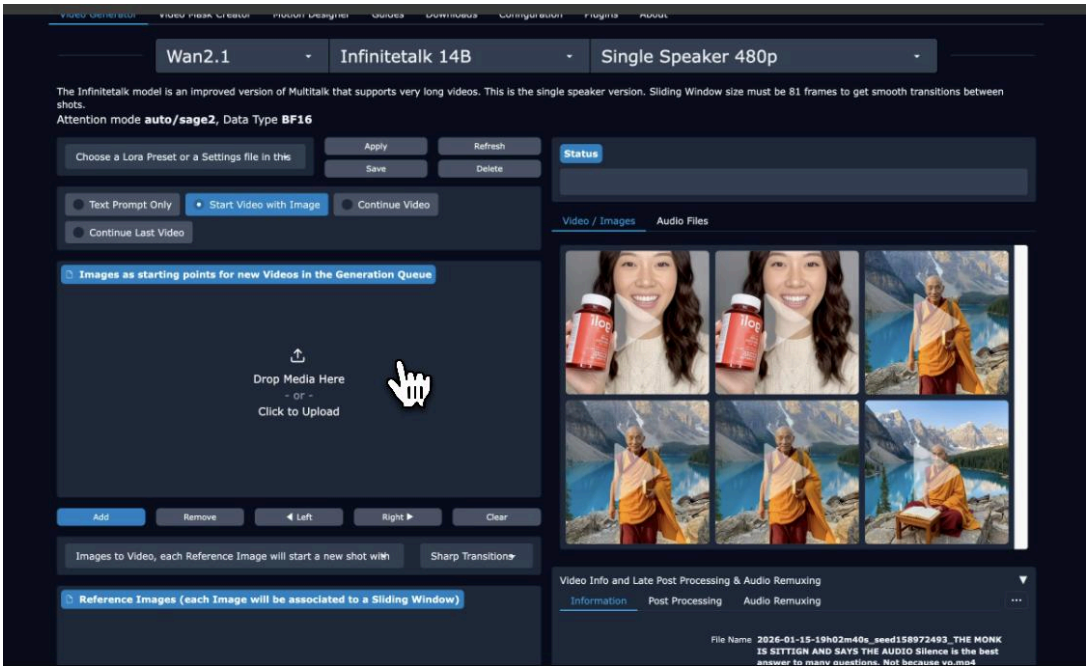

- **Single Speaker 480p** (for one person talking)
- **Multi Speaker** (for multiple people in the video)

If you're creating content with just one person talking in the video, keep it on Single Speaker 480p.

Generation Process

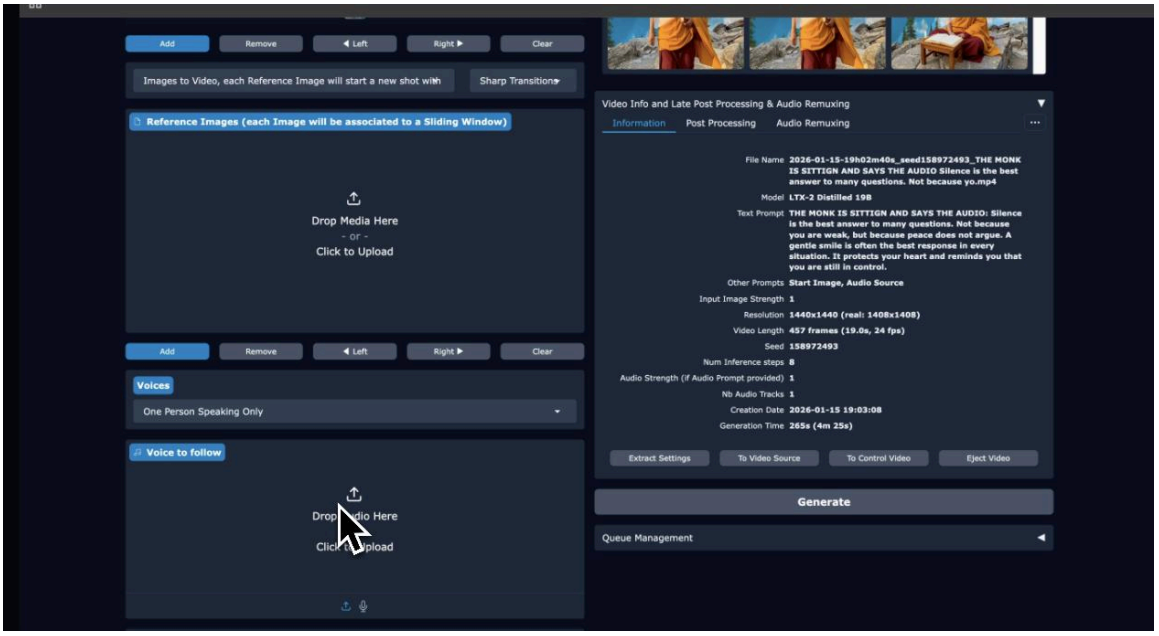

Step 1: Attach Your Starting Frame

Upload the starting image you want to use for the video. This should be your character's initial pose created with Nano Banana Pro or another image generation tool.

Step 2: Upload Your Audio

Attach the audio file you want to use with your starting frame. Use audio generated from ElevenLabs or MiniMax as covered in the audio module.

Step 3: Set Video Length

You can control the length you want for the final video using the duration settings.

Step 4: Generate

Click the Generate button and the video will begin processing.

Important note about generation time:

InfiniteTalk takes longer to generate than some other models. You'll need to be patient during the generation process.

Alternative for faster generation:

If speed is critical, you can use InfiniteTalk publicly on their website (https://www.infinitetalk.net/?i=t3w4w)
for faster processing, though at a higher cost.

Workflow Summary

1. Open WAN2GP via RunPod
2. Select Wan2.1, then choose InfiniteTalk from dropdown
3. Set to Single Speaker 480p (for one person videos)
4. Upload your starting frame image
5. Attach your audio file
6. Set desired video length
7. Generate and wait for processing

Tips for best results:

- Use high quality starting frames from Nano Banana Pro
- Ensure your audio matches the environment and character
- Be patient with generation times
- Consider using their paid website for time sensitive projects

InfiniteTalk fills a specific niche in the open source ecosystem: long form talking head content. While it's not the fastest option, it's designed specifically for extended dialogue videos where consistency matters more than generation speed.
