Two Approaches, One Goal

There are two ways to get content onto Facebook:

1. Post directly to Facebook
2. Cross-post from Instagram to Facebook

Both work. Both have people printing with them.

The right choice depends on your workflow and what you're trying to optimize for.

This lesson breaks down both approaches so you can decide which fits your situation. Or you might realize you want to do both.

The Cross-Posting Method

Cross-posting means you post on Instagram, and that same post automatically goes to Facebook at the same time.

One upload. Two platforms. Zero extra work.

How to set it up:

1. Go to Instagram settings
2. Find "Account Center" or "Accounts Center" (Meta keeps moving this around)
3. Look for "Connected Experiences" or "Sharing to Other Apps"
4. Find the cross-posting option for Facebook
5. Log into the Facebook account you want to connect
6. Select which Facebook Page you want posts to go to
7. Enable automatic sharing for Reels

Once this is set up, every time you post a Reel on Instagram, it automatically posts to your connected Facebook Page.

The benefits of cross-posting:

Efficiency. You're already creating content for Instagram.

This takes that same content and puts it on Facebook with literally no additional effort.

No extra uploading. No extra scheduling. No extra anything.

For someone posting 3-5 times per day across multiple platforms, this time savings adds up fast.

Consistency. You'll never forget to post on Facebook because it happens automatically.

Your Instagram posting habit becomes your Facebook posting habit without thinking about it.

The potential downsides:

Some people report slightly different performance.

A few creators have noticed their content performs better when posted natively to Facebook rather than cross-posted.

This isn't universal, but it's worth knowing.

The Direct Posting Method

Direct posting means you go to Facebook separately and upload your content there, independent of Instagram.

How to do it:

1. Open your Facebook Page
2. Create a new Reel or video post
3. Upload your video file
4. Add your caption, hashtags, and link
5. Post

Simple. You're just posting to Facebook like it's its own platform. Because it is.

The benefits of direct posting:

Full control. You decide exactly when to post, what caption to use, how to format everything.

You can optimize specifically for Facebook without worrying about Instagram.

Native uploads might perform better. Some creators swear their videos get pushed harder when uploaded directly to Facebook rather than cross-posted.

Facebook may give slight preference to native content. The data on this is mixed, but it's a theory worth considering.

Different content for different platforms. You can post something on Facebook that you don't post on Instagram.

Maybe you want to test a different hook.

Maybe you want to post more frequently on Facebook.

Direct posting gives you that flexibility.

The potential downsides:

More work. You're now managing Facebook as a completely separate platform.

That's another app to open, another upload to do, another caption to write.

Easy to forget. Without the automatic cross-posting, Facebook becomes another thing on your to-do list.

When you're busy, it's easy to skip.

What Most Successful Creators Do

Here's the honest truth: most people printing on Facebook are cross-posting from Instagram.

It's just easier. You're already posting on Instagram anyway. Why not let that same content go to Facebook automatically?

The people posting directly to Facebook tend to be either:

1. Running Facebook as their primary platform
2. Testing Facebook-specific content strategies
3. Managing at scale with VAs handling each platform separately

If you're just getting started, cross-posting is the move. Get your content on Facebook with minimal friction. See how it performs. Learn the platform.

Once you're more established and want to optimize specifically for Facebook, you can experiment with direct posting or a hybrid approach.

The Critical Mistake: Not Branding Your Facebook

Here's where people mess up.

They set up cross-posting. They start posting. Content is flowing to Facebook automatically.

But they never actually set up their Facebook Page properly.

Remember: even though your posts are connected, your Facebook Page is still separate from your Instagram.

Your Instagram bio doesn't transfer to Facebook.
Your Instagram link doesn't transfer to Facebook.
Your Instagram profile picture might not be on your Facebook Page.

So what happens? Someone sees your video on Facebook, likes it, taps to see your page, and finds... nothing. No bio. No link. No way to join your community.

You just lost a potential follower and customer because you didn't spend five minutes setting up your Facebook Page.

Before you start cross-posting, make sure:

- Your Facebook Page has the same profile picture as Instagram
- Your Facebook Page has a complete bio
- Your Facebook Page has your website/community link
- Your Facebook Page looks like an active, legitimate brand

Cross-posting handles the content. You still have to handle the branding.

The "Recommend to Facebook" Warning (Again)

I mentioned this in the last lesson but it's important enough to repeat.

When you're setting up cross-posting in Instagram's settings, you might see an option called "Recommend to Facebook" or "Recommend on Facebook."

This is NOT the same as cross-posting to your Page.

"Recommend to Facebook" pushes your content to Facebook users, but without connecting them to your actual Page. They can't see your profile. They can't follow you. They can't click your link.

The views look great. They mean nothing.

Make sure you're cross-posting TO YOUR PAGE, not just "recommending" to Facebook.

When set up correctly:

- Your video appears on your Facebook Page
- People can tap through to see your full Page
- People can follow your Page
- People can click links in your bio and comments

When set up incorrectly (Recommend to Facebook):

- Your video appears in Facebook feeds
- People tap your profile and see a dead end
- No follows, no links, no conversions
- Vanity metrics that don't build anything

Double check your settings. This one mistake can waste months of effort.

Posting Frequency Considerations

One question that comes up: should you post at the same frequency on both platforms?

On Instagram, posting 3-5 times per day is common and works well.

On Facebook, you can post even more. There's no real limit. People post 5-10+ times per day without issues.

If you're cross-posting, your Facebook frequency matches your Instagram frequency automatically. That's fine. It works.

But you could also add extra posts directly to Facebook on top of your cross-posted content. This gives you:

- All your Instagram content on Facebook (via cross-posting)
- Plus additional Facebook-only content (via direct posting)

This hybrid approach gives you the efficiency of cross-posting plus the extra volume that Facebook allows.

Something to consider once you've got your basic system running.

Timing and Scheduling

Just Post.. It does not matter the time, i’ve posted at 3am and still gone viral, don’t overthink this.. content quality is all that matters

The Technical Setup Walkthrough

Let me give you the exact steps for cross-posting setup:

On Instagram:

1. Go to your profile
2. Tap the menu (three lines, top right)
3. Tap "Settings and privacy"
4. Tap "Account Center" (or "Accounts Center")
5. Tap "Connected experiences"
6. Tap "Sharing to other apps" or similar
7. Select Facebook
8. Log into your Facebook account if prompted
9. Select the Facebook Page you want to connect
10. Enable sharing for Reels

Verify it's working:

Post a test Reel on Instagram. Wait a few minutes.

Check your Facebook Page. The same video should appear there.

If it's not showing up:

- Check that you selected the right Page
- Make sure sharing is enabled for Reels specifically
- Try disconnecting and reconnecting the accounts

On your Facebook Page:

After cross-posting is set up, go to your Facebook Page and check:

- Is the video actually there?
- Does the caption look right?
- Can you tap through to your full Page?
- Is your bio and link visible?

If anything looks off, fix it now before you post 100 more videos to a broken setup.

What's Next

Your accounts are connected. Content is flowing to Facebook.

But posting content is just the beginning. The real question is: how do you get that content to actually go viral?

In the next lesson, we'll cover priming your Facebook account. What it means, how long it takes, and the signs that your account is on the path to consistent viral views.

That's where the real money starts flowing.
