BONUS · THREE

The US Targeting *Protocol*

How to target the US audience from anywhere in the world. The full hardware, identity, and network setup. The protocol that tricks the platforms into believing you are physically in the US.

BONUS · THREE

The US Targeting *Protocol*

Most international creators fail to crack the US market. They use a cheap VPN, upload from an Android, and get zero views (or instant shadowban). **The algorithm is smarter than your VPN.** It looks for inconsistencies in your data.

99%

SUCCESS RATE

After months of testing, this is **the only engineering protocol that reliably tricks the platforms into believing you are physically in the US**. Three phases. Each one matters.

PHASE ONE

1 *The hardware layer.*

iPhone is **non-negotiable**. Do not try this with an Android. Android OS leaks GPS and location data deeper than iOS, even with spoofers.

Use a dedicated iPhone

Can be an older model (iPhone X or 11 works fine). The point is that this device is **dedicated to your US identity** and nothing else.

Factory reset before you start

Wipe everything. You are building a clean US identity from scratch. Any residual data from another region is a leak waiting to happen.

imarketing.courses

PHASE TWO

2 The identity setup.

Before downloading any apps, configure the phone to **become American**. The platforms read these settings as proof of who you are.

Region & timezone

Settings → General → Language & Region. Set **Region to United States**. Disable "Set Automatically" for date and time, then set it manually to New York (EST) or Los Angeles (PST).

The clean slate (iCloud)

Create a **brand new Apple ID**. When asked for a region or address, select United States. This account must match the rest of your identity.

Location services off, completely

Privacy & Security → Location Services → **TURN OFF COMPLETELY**. Never turn this on for the social apps. The VPN handles your location. The phone should not be confirming or denying it.

PHASE THREE · THE GAME CHANGER

3 The network layer.

This is where **90% of people fail**. They use a standard VPN (Surfshark, Nord) and connect to a "New York" server. Problem: **thousands of spammers use that same IP address.** The platform flags it immediately.

The dedicated IP solution

You need to buy a **Dedicated IP add-on** (available on NordVPN or Surfshark). This gives you a private US address that **only you use**. Not shared with strangers, not flagged as a VPN pool.

Match the city across everything

Your iCloud address, your timezone setting, and your Dedicated IP city must **all match**. Example: iCloud address in Manhattan → timezone EST → Dedicated IP in New York. Mismatch is the inconsistency the algorithm looks for.

THE WARMING-UP MYTH

Warming up accounts is a myth.

You can wait 24 to 48 hours and like and engage **for peace of mind** if you want to. But 90% of the time, you just have to post good content and you will be fine. The algorithm rewards the content, not the days the account sat there pretending to be a normal user. **Do not let "warming" become an excuse to delay posting.**
