MODULE 3.1

The Three Ways to Make Content *Now*

There used to be one real way. Now there are three, and you do not have to pick one and stick with it forever.

MODULE 3.1

The Three Ways to *Make Content* Now

In this business there used to be one real way to make content, which was filming it yourself. **That is over. We do not film anymore.** Everything you make is going to come from one of three methods, and all three run on AI.

The three methods

1. AI Generation

The main method, and the one most of the course is built around. You generate your own characters, your own product clips, and your own scenes with AI, so you never have to touch the product or appear on camera yourself. This is what lets you run almost any product from your laptop without ordering anything.

2. Editing and Repurposing Content

Taking content that already exists, usually a competitor's, clipping it into short pieces, and combining those pieces with your own material into something new. You are not reposting someone's video. You are cutting it up and building your own video out of the parts. Sometimes called ripping, but we are going to call it editing and repurposing, because that is actually what it is.

3. Hybrids

Mixing the first two. An AI-generated hook at the start, repurposed clips in the middle, an AI-generated product reveal at the end. Most of your best content over time will probably be some kind of hybrid.

You do not have to pick one and stick with it forever. Different products and different situations call for different methods, and a big part of getting good at this is knowing which one to reach for. The rest of this section breaks down all three.

BEFORE WE GO FURTHER

You have already been through the main course, so you know how to actually operate the AI tools. You know how to generate an image, how to animate it, how to prompt. **This section is not re-teaching the buttons.** It is about the strategy behind each method. What to make, why, and when to use which one. We will still name tools and give you real workflows when it helps, but the mechanics are assumed.
