MODULE 3.2

AI Generation, *the Core Method*

AI generation is the heart of this whole business now. The idea is simple. Instead of getting a product in your hands and filming it, you generate everything you need with AI. The setting, the action, the product, and in many cases the person, all of it. **You never touch the product. You never appear on camera.** You sit at your laptop and you build the content.

The first thing to lock in is that there is no single template for what an AI-generated video has to look like. Different products call for different styles, and you choose the style that suits the product, not the other way around. **There are three you will use most.**

STYLE ONE

Character-led content

The version most beginners picture first. There is a person in the video, the avatar, and they are showing, using, or talking about the product. The character can be a **one-off generated for a single video**, or a **reusable character** you build once and use across many videos so the account has a consistent face. The character can be doing a get-ready routine, reacting to the product, demonstrating it, narrating, or just being in the scene.

The reason character-led content matters so much is **targeting**. Because you control exactly who appears, you can match the person to the audience you want to reach. If your product is for older men, your character is an older man. If your product is for young women doing their skincare, your character is a young woman doing her skincare. You are not stuck using yourself or hoping the right people see it. You build the exact person your buyer will relate to.

WORKS BEST FOR

Products where a human in the frame adds something real: **skincare and beauty, fashion, anything that needs a before-and-after on a person, anything with an emotional or lifestyle angle, anything where a narrator or a reaction carries the video**.

STYLE TWO

Product showcase content

Plenty of products do not need a character at all. **The product itself is the star**, and the entire video is the product being shown off, used, or revealed. No person in frame, no avatar, just the product in a clean setting, often with movement, lighting, and a beat-drop reveal doing the work.

Think of products like an aesthetic projector, a humidifier with a striking visual effect, a piece of jewelry shown in close-up, an advent calendar opening day by day, a vinyl record with a striking design, a unique gadget that goes through its motion. These are products where **adding a human in the frame can actually distract from the wow factor**. The strongest version of the video is the product, the setting, and the reveal, nothing else.

Showcase content has its own craft. The lighting, the background, the small details around the product, the pacing of the reveal, the way the camera moves into the shot, all matter even more, because there is no person to draw the eye and hold attention. **Everything in the frame has to earn its place.**

YOU KNOW A PRODUCT BELONGS HERE IF

The wow factor is in the product itself, a close-up or aesthetic shot is what stops the scroll, or your best competitors are running it without a character. **Do not force an avatar into the video just because that is what you saw someone else do with a different kind of product.** Let the product carry it.

STYLE THREE

Hybrid: character in the hook, showcase in the body

The third style is the mix, and a lot of strong videos use it. You use a **character in the opening seconds, the hook**, to stop the scroll with a relatable moment, a reaction, or a line, and then you cut to **clean showcase content of the product for the body and the reveal**. The character grabs attention. The product carries the sell.

This is the same logic as the hybrid method in the next module (Module 3.4), just inside a single AI-generated video instead of mixing AI with repurposed content. You generate a hook clip with a character, you generate the product showcase clips separately, and you edit them together into one video. Best of both: a human moment to stop the scroll, a clean product reveal to do the work.

What is always being generated

Whichever style you use, the building blocks are the same. **The setting and the action are always generated. The product is generated** (or placed into the generated scene) even if you have never held it. **The character is generated when the style calls for one**, and skipped when it does not.

The workflow you know from the main course holds either way: start with a strong reference image, generate or place the elements you need, write the prompt for the action, animate the image into a clip, fix errors as they come up, repeat for each clip, and edit them together.

The strategic side

What decides whether the result looks real or looks fake comes down to the same three things regardless of style. They get full treatment in the rest of this section.

Realism of the starting image

The single biggest factor in whether your video looks real or looks fake.

Quality of your prompting

Decides how close you get to what you actually wanted.

Willingness to iterate

Running it again and again until it is right. What separates content that converts from content that gets ignored.

"AI generation means you can run any product, target any audience, and produce content at volume."

The shape of the video, character-led, showcase, or hybrid, is a creative choice that flows from the product. The engine underneath is the same.
