MODULE 6.4

Test Ordering: Knowing Exactly How Much a *Product Makes*

Everything so far tells you whether a product *looks* good. Test ordering tells you, with real numbers, **how much money a competitor is actually making with it**. This is the most precise validation you can do, and if you have a little money to spend, it is worth doing before you commit to a product.

The idea is simple. You place an order on a competitor's store to find out their order number, which tells you how many sales they have had. Then you compare that to how many views they have generated, which tells you **how much revenue they are making per million views**. That number is the real measure of whether a product converts.

How to get the order count

Most stores in this space run on Shopify, and **Shopify order numbers start at 1,000**. So if you place an order and your confirmation number is 1,050, that means they have had 50 orders.

You usually do not even have to buy the actual product. Most of these stores offer **shipping protection** for a couple of dollars at checkout. Buy just the shipping protection, complete the order, and you will still get a confirmation email with your order number. If the store has no shipping protection option, you will have to actually order the product and spend a bit more.

ONE GOTCHA TO KNOW

Sometimes the confirmation email comes back with a garbled order number, a mix of numbers and letters instead of a clean four-digit number. If that happens, you cannot read the count, and you will have to **place another order** to get a usable number.

How to turn that into revenue per million views

1

Add up their total views

Go to the competitor's TikTok and Instagram and add up the views across all their videos on both platforms. **Add everything together into one total.**

imarketing.courses

2 **Estimate their average order value**

If they only sell one product with no bundles at $50, their AOV is about $50.

3 **Multiply orders × AOV to get revenue**

Then divide by total views to get **revenue per million views**.

WORKED EXAMPLE

A competitor's product, the full math.

Test order confirmation number	*1,050*
Shopify starts at 1,000, so orders	*50*
Total views across TikTok and Instagram	*1,000,000*
Average order value (1 product, no bundles)	*$50*
Revenue: 50 orders × $50	*$2,500*
REVENUE PER MILLION VIEWS	*$2,500*

Reading the number

BENCHMARK

$2,000 per million views

Roughly the minimum you want to see. **Below that, the product may not be worth it** for you.

THE TRADE-OFF

Easier-to-go-viral products

Some products convert at $1,000 per million but are far easier to rack up views with. A low rate is **not an automatic no** if the product gets views cheaply.

imarketing.courses

"Hard proof that a product is making money, before you spend a dollar building anything around it."

This method gives you something the other checks cannot. The other validation checks tell you a product looks like it should convert. Test ordering tells you **it does, and exactly how well**.
