MODULE 6.5

# Reading *Comment Demand:* The Real Signal

The single most reliable way to know whether a product actually converts, before you commit a single video to it, is **the comment section**. Not the view count, not the like count, the comments. Comments tell you what the audience actually feels about the product, and more specifically, whether they want to buy it. If you learn to read a comment section properly, you save yourself weeks of running products that were never going to sell.

## Start with volume

Comments relative to views are a strong signal of how much a product moves people to act. **As a rough benchmark, a video with around 100K views should be pulling 50 to 100 comments.** If a video has 100K views and only a handful of comments, that is a warning sign on its own. The audience watched but did not feel anything strong enough to type. High comment counts at moderate view counts mean people are reacting hard, and that is what you want.

But the count alone is not enough. The more important question is **what the comments actually say, and who is saying them**.

## Engagement vs. demand

There is a critical difference between engagement and demand, and it is the thing most beginners miss.

ENGAGEMENT

### *Generic praise. No buying intent.*

*"this is beautiful"*
*"I love it"*
*"wow"*
*"<tag a friend>"*

People liked the video. **They did not want the product enough to actually do anything about it.**

DEMAND

### *Purchase intent. Real signal.*

*"where can I buy this"*
*"drop the link"*
*"how much"*
*"I need this"*
*"link please"*

People who have moved past liking the video to **wanting the product**.

imarketing.courses

A comment section full of "where to buy" means the product converts. A comment section full of "this is beautiful" with no buying questions usually means it does not, even if the view count looks great. **This is one of the most reliable predictors of whether a product makes money**, and you get it before you spend a single dollar.

THE ONE EXCEPTION

When the engagement ratio is extraordinarily high, when a video is pulling **an enormous number of comments relative to its views**, way above the normal range, the product can still convert well even if not every comment is asking to buy. That density of reaction is itself a strong signal. But this is the exception, not the rule.

## Who is actually commenting

This is the step that separates real demand from demand that looks good on the surface and converts to nothing. A comment count alone, and even purchase-intent comments alone, do not tell you the product will make money. You have to **click into who the commenters actually are**, because some demand never turns into sales.

Three things to check on the profiles of the people asking where to buy.

### *"Are they real people, or burner accounts?"*

Burner accounts have **no posts, no following, generic usernames**, and they exist purely to scroll products the same way yours does. If a wave of "where can I buy this" is coming from accounts that look like burners themselves, those are other operators scrolling, not buyers. Their demand means nothing for your conversion.

**Click a few profiles. If the accounts look hollow, the demand is hollow.**

imarketing.courses

### *"Are they from converting regions?"*

This is the big one, and it is where a lot of beginners get fooled.

**CONVERTING REGIONS**

**US first and foremost**, then Canada, the UK, Australia, Germany, and parts of Western Europe. Markets with the buyer payment systems, the income, and the shipping infrastructure for organic to turn into sales.

**LOW-CONVERTING REGIONS**

India is the classic example, but it applies to **parts of Africa, much of Southeast Asia, and parts of Eastern Europe** too. Demand will not become orders no matter how loud it is.

Click profiles, look at locations and context clues like language and content they post, and weight the demand by where it is coming from. **A small wave of real US demand beats a flood of comments from regions that will not buy.**

### *"Are they actually old enough to buy?"*

If most commenters are clearly kids, twelve, thirteen, fourteen, they typically do not have the money or means to purchase. Some products still convert with younger audiences, especially when a **parent is the actual buyer** (covered in the ICP module). So a few young commenters in the mix is not a disqualification.

But a comment section **dominated** by very young accounts with almost no adults in it is a weak signal, and the safer play is to keep looking for products where the demand is coming from people who can actually pull out a card.

**THE STRONGEST POSSIBLE DEMAND SIGNAL**

## *When you see all of this on a product, you have something worth running.*

- **Dense comments** relative to views.
- Full of **purchase intent** rather than just praise.
- Coming from **real adult accounts**, not hollow burners.
- In **converting regions**, Americans especially.

## Cross-check with the competition

Comment demand is one half of the picture. The other half is **how many people are already running the product**, because demand alone does not mean you have a lane.

If a product is showing strong demand but ten operators are already on it in the same angle, your job is much harder. So always pair the comment-demand check with a quick competitor check. Search the product on TikTok and Instagram, see how many accounts are actively running it, and see how they are running it. The full framework for handling competition, the four questions you ask, and the new-color and new-angle moves, is in **Module 6.3**.

> *"Demand without a lane means a crowded room. A lane without demand means nothing to capture."*

The two halves together, **confirmed real demand plus a clear lane to capture it**, are what tell you a product is genuinely worth your time. Either half alone is misleading. Both, and you have a winner.
