MODULE 7.1

How to Test a *Product*

Plan your formats, generate your test videos, give the product its window, and hunt for the outlier that breaks everything open.

MODULE 7.1

How to *Test* a Product

Once you have found a product, validated it, and decided to run it, the next phase is testing. Testing is where you put the product in front of the algorithm and find out whether it actually performs. **Do not overthink this phase, but do not rush it either.**

Plan your content first

Before you make a single video, sit down and write out **10 to 15 different content ideas or ad formats** for the product. This matters because, as covered in the criteria, a product you only have one idea for is a product you can easily get stuck on. You want a list of angles and formats ready to go before you start, so you are never sitting there wondering what to post next.

Testing ad formats is the core

An ad format is a proven content structure that already works, like **"3, 2, 1, let's see how it comes out," "run to IKEA,"** or an emotional concept. You are not inventing new content styles from scratch. You are taking formats that are already proven to go viral and applying them to your product. **The whole goal of testing is to find which proven format your product responds to best.** That winning format is what you will scale later.

THE AI ADVANTAGE

Because you generate your content instead of filming it, you can produce test videos quickly and in batches. **You are not limited to testing one product at a time.** You can test several products at once, running multiple formats across each, because the production cost per video is so low. Where the old way had you carefully testing one product because each video was expensive, you can now run five at the same time and let the data tell you which is the winner.

imarketing.courses

The testing window

~20	2–3/day	1
VIDEOS	**POST FREQUENCY**	**OUTLIER**
The window. Give the product this many before you decide.	The sweet spot per account. Quality beats quantity.	What you are hunting for. One video far above the average.

Over those ~20 videos you are watching how the algorithm responds. If you go 15 to 20 videos deep and you are getting no traction at all, drop the product and move on. **There is no reason to keep forcing a product the algorithm is ignoring.** But if you start getting traction, videos hitting 20K, 30K, 40K, 50K views, with real demand in the comments, you have something, and you move into the next phase.

"During testing, your job is to find an outlier. That outlier kicks off split testing."

How often to post

Post **two to three times a day per account**. That is the sweet spot. You can post more if you are producing genuinely quality content at that pace, but two to three is the realistic baseline. **Posting five mediocre videos a day will get you nowhere. Posting two strong ones will.**

Spread your posts out across the day rather than dumping them all in one hour. The specific hour you post does not matter (as covered in the myths section). Convenience and spacing are the only real considerations.

How long to give a product before you drop it

Beginners agonize over when to quit on a product. The honest, usable rule is simple. **Give a product up to roughly 20 posts to show traction.** Inside that window, the early signal you are looking for is views, even modest ones.

imarketing.courses

THE EARLY CHECKPOINT

If you are **6 to 10 videos in and still not consistently hitting at least 1,000 views per video**, that is a red flag. It is one of two things: a content-account issue (the account itself is a dud, see the multi-account systems in Section 12) or a product issue.

If you have strong conviction the product is a banger, the move is to **spin up a fresh account in parallel and try again on that one**. If the second account also will not move, the product is the problem and you drop it. **No emotional attachment, no dragging the test out for weeks.** Move on.

That is the discipline that lets you actually run two to three products at a time and learn fast: each one gets its window, gets a clean verdict, and then it is replaced by the next one. **The whole point of the cycle is that you stop sinking weeks into products that have already told you no.**

The four phases of testing a product

Inside the ~20-video window, the smart way to run content, **especially when you are still learning what viral content looks like**, is to work through clear phases that take you from proven copy to your own concept. These are not the only concepts that work in AI organic right now, there are many more, but they are **the easiest place for a beginner to start** because they are already proven. Once you have a feel for what makes content hit, you branch out into the wider set of concepts.

PHASE

1

Copy your biggest competitor one to one.

From the competitors you researched, take their **top five most viral videos** and remake them as closely as you can. One to one means frame for frame, bar for bar. Same hook, same text, same audio, same movement, same kind of setting. You are not adding your own twist yet. The closest copy gives you the cleanest read on whether your product responds the same way. Even if their videos only did a couple hundred thousand views, those are still the top ones to copy.

imarketing.courses

PHASE 2

Copy similar products.

Widen the net. Find products similar to yours, different variants, different designs, different niches with the same kind of product, and copy the videos that worked for them. You can lift the movements, backgrounds, text, and concept. **The only thing you change is the part that names their audience or specific item**, swapping it to match yours. If a Harry Potter advent calendar's text says "the perfect gift for Harry Potter fans," your Disney version says "the perfect gift for Disney fans." Same structure, your context.

PHASE 3

Copy proven viral concepts from any product.

Go even wider. There are content formats that go viral right now across all kinds of products: **"3, 2, 1, let's see how it comes out," "run, don't walk."** If you see a concept consistently going viral on the burner regardless of what product it is attached to, take that concept and apply it to your product. The concept is proven. The product is yours. **This is where you start finding angles your direct competitors are not using yet.**

PHASE 4

Spam whatever is working.

As soon as one of the videos from phases one through three breaks out as an outlier, **you stop diversifying and start spamming that exact concept**. Make more of it. Small variations only. The mistake most people make is the opposite: a video does well and they never make another like it. That is backwards. When the algorithm rewards something, give it more of that thing. Spam the winner, and the system you use to scale it further is the split-testing system in the next section.

Between each phase you are analyzing. The phases are not strict rules. They are an order that takes you **from safest (proven copy) to most original (your own concept)** so you build evidence as you go.

imarketing.courses

BEYOND THE BEGINNER PHASES

The four phases above are a starter framework, not the full library of viral concepts. **Once you have a feel for what makes content hit, branch out.** The **Bonus Resources section** at the end of the course has a curated swipe file of real winning products and ads currently working in the market: wow factor products, emotional angles, hybrid AI + stitch concepts, hidden ads, passionate-niche winners, and more. Pull from any of them.
