MODULE 11.1

Understanding *Outliers*

Before you can split test, you have to understand what an outlier is, because the entire system is built on it.

MODULE 11.1

Understanding *Outliers*

An outlier is a video that does **far more views than your account's average**. That is all it is. It is relative to your own numbers, not to some fixed view count.

WHAT AN OUTLIER LOOKS LIKE

Average: 2K to 4K views	→	*8,500 views*
Average: 50K views	→	*100,000 views*
Average: 20K to 30K views	→	*50,000 views*

The number does not matter on its own. **What matters is that one video performed dramatically better than your usual.**

Why this matters so much

An outlier is **the algorithm telling you it likes something about that video**. When you are testing formats, your whole goal is to find a winning concept for your product, and an outlier is a potential winning concept revealing itself. Your account took that format unusually well, which means there is something in it worth doubling down on.

THE UNDERLYING TRUTH

Nothing goes viral or gets dramatically more views for no reason. **There is always something specific about an outlier that made it perform**, and the job from here is to figure out what that something is and then squeeze every bit of value out of it. That is exactly what split testing does.
