MODULE 12.2

The Multi-Account *System*

Here is how the system actually runs once you have a winner.

Keep a stable of accounts, not one or two

When you find a winning product and a winning format, you load that format onto multiple accounts and post it across all of them, across every platform: **the fast-burn platform for quick hits, the slow-burn platform where the real money tends to come in, and the one that hits last but can explode**. Same proven content, many accounts, many platforms, all at once.

Accounts are reusable

You do not need a fresh account for every product. When you are done running a product on an account, **you cycle a new product onto that same account**. An account that ran one niche can be pointed at a completely different niche and still take off. This means over time you build up a set of seasoned accounts that you rotate products through, rather than starting from zero every time. **That stable of accounts becomes an asset in itself.**

WHY AI MAKES THIS POSSIBLE

Scaling across accounts costs you almost nothing in production. The content is generated, so **feeding ten accounts is not ten times the work**. It is the same generated assets and their variants distributed across all of them. The thing that used to make multi-account scaling painful, producing enough content to feed every account, is largely solved when you generate instead of shoot.

The discipline from the split-testing section still applies. Across all these accounts you are mostly running your locked winning format with the background rotated, while still seeding new formats so you are always fishing for the next winner. **Multi-account scaling and format-hunting run at the same time.**
