MODULE 13.3

Document & Analyze *Everything*

Reps only compound if you learn from them. The difference between failing 100 times and learning nothing, and failing 100 times and extracting a lesson from each one.

MODULE 13.3

Document & Analyze *Everything*

Reps only compound if you learn from them, and learning requires actually looking at what happened instead of just moving on. **So document your work.** When you run a product, write down what it was, what you tried, and how it did. When a video performs, go into the analytics and study the watch time and retention. When something works, understand why. When something flops, understand why.

What to actually track

A simple system beats a complicated one you will never use. **A spreadsheet or a notes document is enough.** For every product you run, write down a small set of things:

1. **The product itself**
   What it was, the niche, where you found it, the date you started.

2. **The concepts you tried**
   Which formats from the four phases (direct competitor copy, similar product, proven viral concept, your own variations), how many videos in each.

3. **The numbers**
   The best video's view count, the conversion comments, total sales if any, **revenue per million views** if you can estimate it.

4. **The verdict**
   Did you drop it, did it print, did it stall and where. **What specifically caused that outcome in your read.**

5. **The one-line lesson**
   What this product taught you about content, the buyer, the niche, or your own process. **Even a flop teaches you something.**

Two more files worth keeping

A running file of winning prompts and generation setups

Covered in the prompting module. When something produces a clean video, do not lose that recipe. **Reuse it.**

A short list of recurring patterns

Patterns you notice across multiple products, like *"products in this niche always die when the angle gets too generic"* or *"this style of hook consistently underperforms for me."* **These cross-product patterns become your real skill over time.**

FIVE MINUTES PER PRODUCT

You do not need to make this elaborate. **Five minutes per product after a test cycle is enough.** The point is that after twenty products you have a body of notes that compounds into real understanding, instead of twenty fuzzy memories.

The biweekly to monthly self-audit

Beyond the per-product notes, build in a regular sit-down with your whole operation. **Every two weeks to a month, take an hour and audit yourself.** What is working, what is not, what should you change, and what should you keep doing. **Treat it like a board meeting with one person on the board: you.**

WHY THE CADENCE MATTERS

Two weeks is the minimum because below that you are reacting to noise; you have not given changes enough time to actually show results. **A month is the maximum** because beyond that you are letting problems compound for too long. Two weeks to a month is the sweet spot.

A trap to watch for is **analysis paralysis**, where you audit so often that you keep changing things before the previous change has had a chance to play out. The action you took last week is still in the algorithm working itself out. **Let it work.** The point of the audit is to see what the data is

imarketing.courses

telling you over a meaningful stretch, not to second-guess every move within days of making it. Make the change, give it two weeks to a month, then audit and decide.

The questions to ask in the audit

What did I do?

What did I run in the last two weeks to a month? What products, what concepts, what formats.

What is the data telling me?

What worked, what did not, where did the signal show up, where was it absent.

Is anything broken?

Or is the system working and the only thing needed is **more time**?

What would I change?

If I want to push the needle faster, what **specifically** would I change? Then make the call, write it down, and run that for the next cycle.

"The work is the work. The audit is where the work gets sharper."

This habit is one of the things that separates an operator who scales from an operator who stays stuck. Without it, you just keep doing what you have been doing. **With it, you compound.**

"The winner and the person stuck at zero may have failed the same number of times. The winner studied each failure and adjusted."

Failing is not the problem. Failing without analyzing is. Treat every product and every video as data, look at it honestly, and **let it sharpen the next attempt**.
