Turning Script Into Prompts

You now have your final script.

This is the transition point.

From text → to visuals.

Before opening Nano Banana Pro or Kling, you need to convert your script into structured image prompts.

Which AI to Use for Prompts?

For this step, I personally use **ChatGPT**.

Not because Claude can't do it.

But because I use the best tool for each task.

- Claude → video topics + script writing
- ChatGPT → prompt engineering

In my experience, ChatGPT is slightly more precise and structured when it comes to building prompts.

If you prefer using one AI for everything, you can absolutely stay with Claude.

What We're Doing Here

We are not asking AI to "generate an image".

We are asking it to:

Break down the script into cinematic scene prompts that can be used inside:

- Nano Banana Pro (image generation)
- Kling (animation)

Each scene should:

- Match one line or moment from the script
- Maintain character consistency
- Follow the same color and atmosphere rules
- Be visually clear and easy to animate

The Process

1. Take your final, refined script.
2. Paste it into ChatGPT (or Claude).
3. Use the **Prompt Structure Template** from the next section.
4. Ask AI to convert your script into scene-by-scene image prompts.

This will give you:

- Structured prompts
- Scene descriptions
- Lighting guidance
- Environment details
- Camera angles

Ready for Nano Banana.

Important:

Do not skip this step and try to freestyle prompts manually for every scene.

Prompt structure is what keeps:

- your character consistent
- your lighting consistent
- your tone consistent
- your brand recognizable

And consistency increases retention.

In the next section, we'll build the exact **Prompt Structure Template** you'll reuse for every single video.

This is where the system becomes repeatable.
