Prompt Structure Template

Before generating any images, we need structured prompts.

Tools I Personally Use

I generate my base images in **Nano Banana Pro**.

Why?

Because the quality is the best I've tested and it consistently gives me the cinematic look I expect.

More details about Nano Banana Pro will be covered in the **Image Generation** section.

For animation, I use **Kling**.

I've tested other tools like Veo3 and Sora. Veo3 often produced a more artificial look. That doesn't mean those tools won't work for you, but for my style and expectations, Kling delivers the most natural cinematic motion.

We'll go deeper into that inside the **Animation Workflow** section.

For now, we focus only on:

Creating structured prompts for both Nano Banana and Kling using ChatGPT.

Which AI to Use

For prompt engineering I use **ChatGPT (latest version - I personally use 5.2).**

You can use Claude if you prefer keeping everything in one place, but in my experience ChatGPT is stronger for structured visual prompt breakdown.

The Goal

We want:

1 sentence from the script = 1 Nano Banana prompt & 1 Kling animation prompt

If a sentence is long, it may require 2 Nano prompts & 2 Kling prompts

Roughly:
1 prompt ≈ 2-3 seconds of video.

Step-by-Step Process

To generate prompts:

You paste into ChatGPT:

1. Your final script
2. Your image references
3. The master prompt (provided below)

That’s it.

ChatGPT will then output ready-to-copy prompts for:

- Nano Banana (image generation)
- Kling (animation)

You copy → paste → generate.

Image References (Very Important)

Before generating prompts, prepare image references.

You will need them later for Nano Banana anyway - so do it now.

Go to channels you want to visually reference.

Take 5–10 screenshots of:

- Different poses
- Different camera angles
- Close-ups
- Wide shots
- Scenes with other characters
- Emotional moments

Make sure there’s diversity.

Then paste those image references into ChatGPT together with your script and master prompt.

Master Prompt (Copy & Paste) For AI

You are a cinematic visual director and prompt engineer.

We are creating a high-quality AI video sequence using:

- Nano Banana (image generation)
- Kling (animation)

The main character is ALWAYS a translucent Skeleton with an organic membrane stretched over bone structure.

The Skeleton plays different roles depending on the script (doctor, entrepreneur, trainer, etc.), but anatomy must remain consistent.

GLOBAL VISUAL RULES (STRICT)

1. Use clean, sharp lighting. Avoid muddy, dark, oversaturated, or chaotic images.
2. Default palette: natural daylight with subtle warmth (white-gold sunlight, soft beige tones, clean highlights).
3. Do NOT use heavy orange or cinematic filters unless script demands it.
4. Avoid overcrowded frames. Each image must have ONE dominant visual focus.
5. If the scene is large scale (crowds, architecture), simplify composition.
6. If it is a close-up, remove unnecessary background detail.
7. Maintain architectural and geographical continuity within the same location.
8. Do NOT overload the image with too many moving elements.
9. Prioritize clarity, sharpness and readable composition.
10. No random objects. Every element must support the script.

SKELETON RULES (MANDATORY)

For EVERY Nano prompt that includes the Skeleton:

- Always describe:
    - Outfit (accurate to time period / context)
    - Fabric texture
    - Footwear
    - Posture
    - Expression

- Always mention:
    - Translucent organic membrane over bone
- Outfit must remain consistent within the same day/location unless script changes it.
- Never write “same as before.”
- Never skip outfit description.

CAMERA RULES

Each sentence = 1 Nano + 1 Kling prompt
(Unless sentence is long - then split logically.)

Each new shot must:

- Change perspective intentionally
- Avoid repeating the same angle twice in a row
- Use logical progression (wide → medium → close → reaction → detail)

Allowed perspectives:

- Wide cinematic
- Low angle
- Over-the-shoulder
- Extreme close-up
- Top-down
- Ground-level
- Symmetrical centered frame
- POV

Do NOT randomly change perspective just to be “creative”. It must serve the scene.

NANO PROMPT STRUCTURE

Nano prompts must:

- Be clear and specific
- Avoid abstract adjectives like “emotional” or “epic”
- Focus on:

    - Composition
    - Lighting
    - Environment
    - Character positioning
- Keep structure clean and readable
- Avoid overloading with too many background elements
- Avoid unnecessary adjectives

Example structure:

[Camera perspective] shot of [main subject] in [specific environment], wearing [full outfit description], under [lighting type], with [1–2 supporting elements only], clean composition, sharp daylight, natural tones.

KLING PROMPT RULES

Kling prompts must:

- Be written in natural descriptive sentences
- Focus on:
    - Camera movement
    - Character movement
    - Subtle expressions
    - Environmental motion
- Avoid exaggerated animation
- Avoid fast chaotic movement

Movement must feel cinematic and restrained.

WHAT TO AVOID

- Overcrowded backgrounds
- Random extra people
- Excessive props
- Overly dramatic color grading
- Inconsistent outfits

- Dark muddy lighting
- Overcomplicated one-frame storytelling

OUTPUT FORMAT

For each script sentence provide:

Scene number:
Image prompt:
Kling prompt:

Now break down the following script into scene-by-scene cinematic prompts while strictly following all rules above.

Script:
[PASTE SCRIPT HERE]

End of Master Script

Important Reminder

Each Nano prompt must:

- Fully restate the skeleton's outfit
- Fully restate the environment
- Fully restate lighting and color

If you don't repeat those elements, Nano will drift visually and then you have to regenerate your images with a correct prompt.

Once ChatGPT generates the prompts, you don't blindly trust them.

You review:

- Are outfits correct?
- Is tone consistent?
- Are camera angles varied?
- Is lighting aligned with script mood?

If something feels off - refine.

Once prompts are finalized, we move to:

Image Generation (Nano Banana Pro Workflow).

This is where everything becomes visual.
