The master ChatGPT prompt (from 5.1 Prompt Structure Template) is designed to generate both image prompts and animation prompts, but that does **not** mean every output will be perfect on the first try.

In practice, ChatGPT has to follow a lot of rules at once, so sometimes the prompts it gives back still need a small correction. This is completely normal.

The workflow should look like this:

1. Send the master prompt together with your script and image references (see screenshot below)
2. ChatGPT generates the prompts.
3. Quickly review them.
4. If something feels off, send a short follow-up message and tell ChatGPT exactly what to improve.

Usually, only small adjustments are needed.

For example, if the camera angles are too repetitive, you can send:

“Use a different, matching camera angle in every shot (low angle, wide shot, over-the-shoulder, close-up, medium shot, upward angle, top-down, angled close-up, foreground framing, etc.). Try not to repeat the same framing across prompts.”

If the Kling prompts are too long, you can send:

“Kling prompts must be short and focused. Include only character movement, camera movement, and at most one additional motion detail. Avoid complex or multiple actions.”

Another common issue is incorrect sentence splitting. If that happens, remind ChatGPT that you want:

“One Nano prompt and one Kling prompt per sentence.”

Of course, this can be adjusted depending on your workflow, but the key idea stays the same:
do not expect the first output to be perfect every time.

Instead, treat ChatGPT as a tool that you guide. Once you correct it once or twice inside the same conversation, future outputs usually become much better.

That is also why it’s best to keep using the **same chat** for future scripts after you paste in your master prompt and fix the first mistakes. Over time, that chat usually gives more accurate outputs than a completely fresh one.

Only start a new chat when the old one becomes too slow, messy or starts underperforming.

Example of ChatGPT image references:

My image references for Chat GPT - as you can see, they might be with subtitles, it doesn't matter (it matters though with Nano banana!). So you can see that I chose very light ones + different skeleton angles (close ones, full body ones, with other people, different emotions etc) so ChatGPT can take inspiration from them
