As mentioned earlier, I generate my images using **Nano Banana Pro**.

In my opinion it's currently one of the most precise image models on the market. It produces an exceptional level of detail, strong cinematic lighting and consistent character rendering - exactly what this format needs.

Nano Banana Pro is a Google AI model and you can access it through:

- **Flow (1 month free!)**
- **Higgsfield**
- **Replicate**
- https://genaipro.vn (Veo3 & Nano Banana Pro for $2 for a full day)

Let me break down the differences.

---

1 Flow (Recommended)

Flow is Google's official platform.

It's the official source for:

- Nano Banana Pro
- Veo3 (if you decide to use Veo instead of Kling)

You get the first month free, which makes it perfect for getting started.

There are daily generation limits, but they're relatively high (roughly in the 100–200 range). Personally I rarely exceed them and I tend to regenerate images MULTIPLE times until they're almost perfect. **BUT if you hit your daily limit on Nano Banana Pro, just switch to Nano Banana 2. Similar results, new limit. Easy.**

Flow is what I use daily.

After the free month, you can:

- downgrade your plan
- or switch to Higgsfield if you prefer a different pricing structure

Website:
https://labs.google/flow/about

---

2 Higgsfield

Higgsfield is a platform offering multiple image and video generators for a relatively low price.

You can access:

- Nano Banana
- Kling
- and other tools

With the right plan, Nano Banana can be effectively unlimited.

If you prefer having everything in one place, Higgsfield is a solid option.

However:
Kling runs on credits there, so you'll need to monitor usage.

Always check their pricing to understand what's included.

Website:
https://higgsfield.ai/

---

3 Replicate

Replicate is useful if you need API access and for some reason cannot use Google's official option.

However it's typically the most expensive solution.

I only recommend Replicate if:

- You need API integration
- Or you have no alternative access

Website:
https://replicate.com/

From here on, the workflow explanation will be based on **Flow**.
On Higgsfield, the process is nearly identical.

Generating Images in Flow (Step-by-Step)

After registering and logging into Flow:

1. Create a new project.
2. At the bottom, you'll see an input field asking what you want to create.
3. Paste your previously generated prompt from ChatGPT (Prompt Structure Template subchapter).
   (Or write your own manually - we'll discuss what must be included in prompts below)

Then configure:

- Mode: **Image**
- Model: **Nano Banana Pro**
- Format: **Vertical**
- Number of generations: between 1–4

Personally, I select 2 generations per prompt.
If something looks slightly off, I either regenerate or adjust the prompt in ChatGPT and try again.

This is how it should look on Flow: "+" icon is where you can attach your image references. Prompt is where you paste your prompt. And settings are where you choose your model, format and quantity.

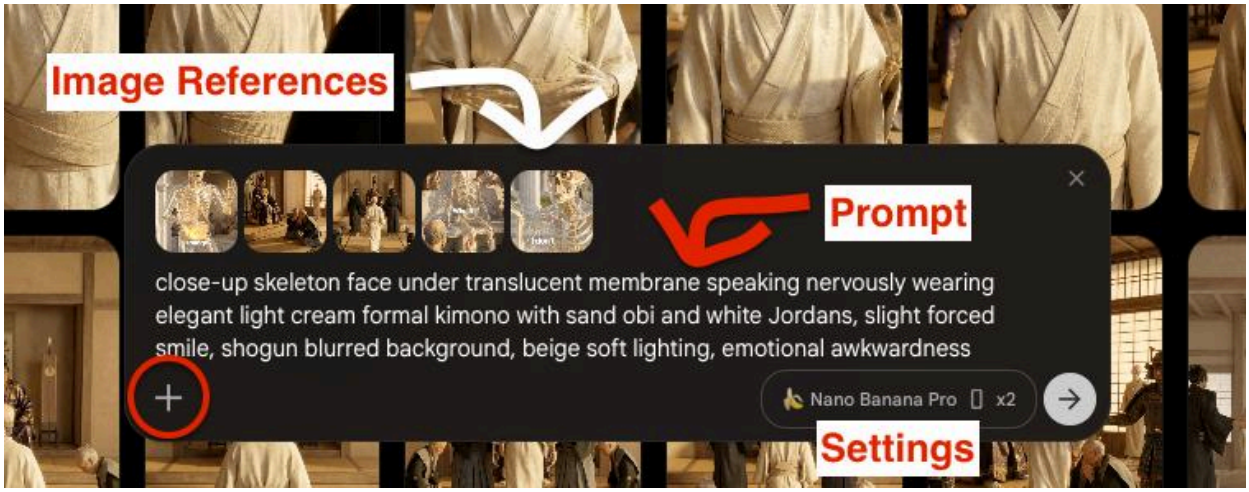

Image References (Very Important)

Below the prompt field, you'll see a small **plus (+) icon**.

This is where you upload your image references.

These are the same references we discussed earlier:

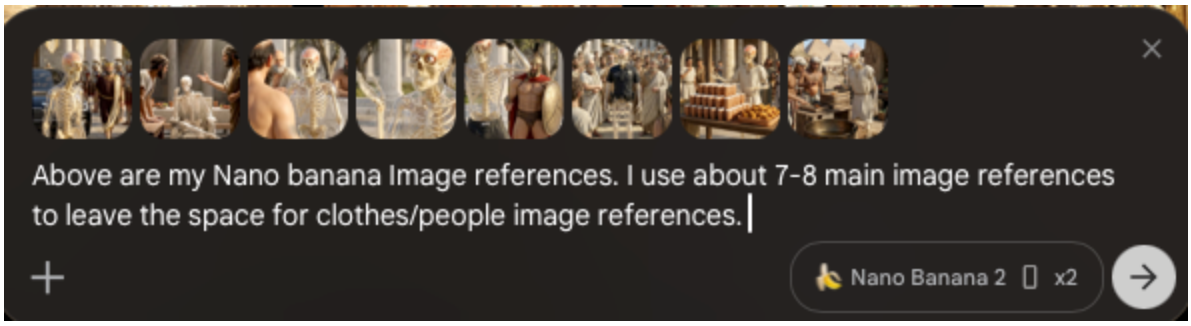

- Screenshots from Skeleton videos you like
- Different poses
- Different camera angles
- Different emotional expressions
- Different scene compositions

Upload around 5–10 image references.

This tells Nano Banana what aesthetic and framing style you want.

Important:
Make sure your references don’t include visible subtitles or text overlays from original videos. Otherwise, text artifacts can appear in your generated images.

In the **6.3** subchapter, I’ll provide a Google Drive folder with ready-to-use image references in case you don’t want to gather them manually.

Writing Prompts Manually (If Needed)

If you ever want to write prompts yourself or ChatGPT gives you something too generic you need to know exactly what a strong Nano prompt must contain.

At minimum, every prompt should clearly define:

---

1 Skeleton Outfit

The skeleton’s base anatomy is already understood thanks to your image references.

Now you must define:

- What is it wearing?
- Does the outfit match the script’s time period?

If you prefer, you can also leave the skeleton unclothed.

The outfit must be explicitly described in every single Nano prompt.

Never assume the model remembers previous details.

---

2 Camera Angle (Very Important)

Every shot should feel cinematic.

Examples of camera angles you can use:

- Close-up (face or upper body)

- Extreme close-up (eyes, skull texture, hands)
- Wide shot
- Ultra-wide establishing shot
- Low-angle shot (camera looking up)
- High-angle shot (camera looking down)
- Over-the-shoulder shot
- Side profile
- Tracking side view
- Front-facing centered composition
- Dutch angle (slight tilt for tension)
- Top-down shot
- Mid-shot with depth
- Dynamic diagonal framing

Each prompt should change perspective.

---

3 Background / Environment

Always define the location clearly.

Examples:

- Ancient Greece marble courtyard
- Ancient Egypt desert temple
- Medieval London street in fog
- Roman battlefield at dawn
- Dark plague-era village
- Mythological Greek colosseum
- Desert caravan route

Be specific.

Not “city.”
But “dusty medieval stone street with wooden market stalls.”

---

4 Character Pose & Interaction

What is the skeleton doing?

- Standing still?
- Walking?
- Holding a sword?
- Looking at a burning city?
- Sitting at a wooden table?
- Facing another character?
- Surrounded by soldiers?

If other characters appear:
Describe their clothing and role briefly.

The more specific the action, the more dynamic the result.

---

5 Lighting & Atmosphere

Examples:

- Cold blue overcast lighting
- Warm golden sunset
- Soft morning sunlight
- Harsh desert noon sun
- Dim candlelit interior
- Foggy diffused daylight
- Dramatic high-contrast shadows

Lighting must match the script’s emotional tone.

Do not randomly mix warm and cold tones unless the story justifies it.

---

6 Color Palette

Define tones like:

- Desaturated earth tones
- Muted browns and greys

- Golden warm highlights
- Deep blue shadows
- Soft marble whites
- Dusty beige desert tones

7️⃣ Texture & Detail (Optional but Powerful)

If you want higher realism, add texture descriptors:

- Rough stone walls
- Worn fabric
- Dust in the air
- Smoke in background
- Sand particles
- Polished marble
- Cracked leather

Quick Manual Prompt Checklist

Every Nano prompt should include:

✓ Skeleton outfit
✓ Clear camera angle
✓ Specific location
✓ Pose/action
✓ Lighting
✓ Color tone
✓ Environmental detail

If ChatGPT fails or you want more control, use this structure as your base template.

But even when using AI - always review prompts.

Generate & Select

Once:

- Your prompt is pasted

- Model is selected
- Format is vertical
- References are uploaded

Click **Generate**.

Wait for the images.

If one looks good:

- Click it
- Download it in **2K resolution**

That’s your final frame.

You then move to the next stage:

Animation Workflow (Kling or Veo)

We’ll cover that in the next section.
