How Many Images Per Video?

Earlier I mentioned that roughly:

1 image ≈ 2–3 seconds of video.

Why?

Because that pacing tends to maintain strong watchability.

When scenes change every few seconds:

- the viewer’s attention stays active
- the brain keeps receiving new visual input
- the video feels dynamic instead of static

In short - movement and variation protect retention.

Is This a Strict Rule?

No.

This is not a mathematical formula for virality.

Animations already include motion:

- camera movement
- character movement
- background movement

So technically, one image could stretch longer if the animation is strong enough.

But from experience, keeping scenes shorter and switching perspectives frequently helps maintain momentum.

Short-form content rewards pacing.

My Personal Approach

Since this blueprint is based on my workflow, here’s what I usually do:

- **1–3 images per sentence**, depending on complexity.

If the sentence is simple and direct:
→ 1 image is enough.

If the sentence is layered, emotional or describes multiple actions:
→ 2–3 images work better.

More complex sentence = more visual breakdown.
