Animation Workflow

We already created Kling prompts earlier in the section:

Turning Script Into Prompts → Prompt Structure Template.

So we won't rewrite them here.

This section focuses on:

- How to actually animate your images in Kling
- What a strong Kling prompt must contain
- And how to avoid common mistakes

Why I Use Kling

For animation, I use **Kling (2.6 or 3.0)**: https://app.klingai.com/global/

- Kling 2.6 → stable, cinematic
- Kling 3.0 → allows Native Audio generation

I'm aware that Kling is one of the more expensive options. It doesn't offer unlimited plans and credits can run out quickly.

In the next subchapter, I'll mention alternatives.

But personally, Kling gives me the most natural cinematic motion. That's why I use it.

Accessing Kling via Higgsfield

You can also access Kling through **Higgsfield**: https://higgsfield.ai/pricing

In some cases, using Kling via Higgsfield can be cheaper than using it directly on the official Kling platform - but this depends on the pricing plan and how many credits you use.

It's worth calculating:

- How many seconds of animation you generate per video
- How many videos you plan to produce weekly
- How many credits that translates to

Sometimes Higgsfield bundles tools together in a way that makes it more cost-efficient, especially if you're already using Nano Banana there.

However, always check the current pricing and compare it with the official Kling plans before committing.

Step-by-Step: Animating in Kling

1. Open Kling.
2. Click **Generate → Video Generation**.
3. Upload your Nano Banana image as the **Start Frame**.

Important:

Leave **End Frame empty**
UNLESS you want a very specific transformation between two frames.

If you want a controlled transition:

- Generate both a start frame and end frame in Nano Banana.
- Upload start frame as Start Frame.
- Upload end frame as End Frame.

Kling will animate from the first image to the second.

This is powerful for:

- scene transitions
- character transformation
- time progression
- movement from one environment to another

If you don’t need that, keep it simple: Start Frame only.

Adding the Prompt

Below the image field, paste your Kling prompt that was generated earlier by ChatGPT.

You can tweak it if needed.

Sometimes:

- motion feels too strong
- camera movement is too fast

- emotion is too weak

Adjust manually if needed.

Multi-Shot Option

There is a feature called **Multi-shot**.

What it does:
Kling automatically generates additional angles and transitions from your single image.

It can look amazing.

But it can also behave unpredictably.

Use it carefully.

It’s powerful, but not fully stable yet.

Settings

Before generating:

- Resolution: **1080p**
- Duration: typically **3–5 seconds**

I choose duration based on the sentence length.

Short sentence → 3 seconds
Longer emotional sentence → 4–5 seconds

In Kling 3.0, you can enable **Native Audio**.

This generates sound effects along with the animation.

It’s a cool feature.

But:
It consumes significantly more credits.

Generate & Export

Click **Generate**.

Wait for the animation.

Once done:

- Watch it carefully.
- If it looks good → download without watermark.
- If something feels off → adjust prompt and regenerate.

What Makes a Strong Kling Prompt?

A good Kling prompt must include very short prompt:

1️⃣ Camera Motion

This is critical.

Examples:

- slow cinematic push-in
- subtle zoom-out
- handheld slight shake
- side tracking shot
- dramatic low-angle tilt
- smooth orbit around character
- quick zoom in

Without camera motion, the scene feels static.

2️⃣ Character Movement

Even subtle motion helps:

- slight head turn
- slow walking
- subtle breathing motion
- hand movement
- cloak flowing
- skeleton turning toward camera

3️⃣ Environmental Motion (Additional)

Add background life:

- dust moving in air
- fog drifting
- fire flickering
- flags moving
- crowd shifting
- wind in fabric

Small environmental movement makes the scene feel alive.

Repeat the Process

You repeat this process for every image in your script.

Generate:

- Scene 1
- Scene 2
- Scene 3
- etc.

Once all animations are ready, you move to:

Voiceover Generation

And that’s where the film truly comes together.
