Special Effects

Sometimes in Skeleton videos, you'll see subtle but powerful visual effects.

For example:

- The brain suddenly glowing inside the skull
- A pulse of light traveling through the body
- Energy moving through veins
- A faint aura around the skeleton
- A shockwave passing through the environment

These effects are not separate VFX layers.

They can be animated directly inside Kling.

You just need to describe them clearly in the animation prompt.

Important Rule

The element you want to animate must be clearly visible in the base image.

If:

- The brain isn't visible
- The chest isn't clearly shown
- The body is too small in the frame

Kling won't know what to animate.

So before adding special effects:

Make sure the animated element is clearly visible in your Nano Banana image.

How to Add Effects in Kling

You simply describe the effect in the Kling prompt.

For example:

🧠 Glowing Brain Effect

Prompt example:

“Slow cinematic push-in. The skeleton stands still while its brain begins to glow with a soft blue bioluminescent light. The glow gradually intensifies, pulsing gently inside the skull.”

⚡ Light Wave Through Body

Prompt example:

“Camera slowly tracks from left to right. A wave of golden energy flows through the skeleton’s body from head to toe, illuminating the translucent membrane briefly as it passes. Subtle dust particles move in the background.”

🔥 Internal Energy Activation

Prompt example:

“Low-angle cinematic shot. A faint red glow starts in the chest cavity and spreads outward through the ribs, like energy activating from within. The light flickers and then stabilizes into a soft internal glow. Slight breathing motion.”

One important tip:

Less is more.

If the effect is too dramatic, it can:

- look artificial
- break immersion
- feel like a video game cutscene
