Camera Motion

If you use my **Prompt Structure Template**, ChatGPT will automatically generate camera motion based on the script's emotional tone.

It usually does a solid job.

However if you want more control or simply want to experiment you can manually adjust camera motion.

Camera Motion Variations You Can Use

Here are different types of camera movement you can include in Kling prompts:

Subtle Cinematic Movements

- Slow push-in toward the character
- Slow zoom-out revealing environment
- Gentle handheld sway
- Soft camera drift to the left
- Slight upward tilt

Dynamic Motion

- Low-angle rising shot
- High-angle descending shot
- Side tracking shot following movement
- Circular orbit around the character
- Fast forward tracking movement
- Diagonal cinematic sweep

Perspective-Based Motion

- Over-the-shoulder shift
- Close-up to medium shot transition

- Focus pull (foreground to background)
- Background reveal pan
- Top-down descending movement

Intensity & Tension Shots

- Sudden subtle push-in
- Slight Dutch angle tilt for tension
- Slow rotation around subject
- Dramatic tilt upward toward sky
- Slow cinematic pullback

Best Practice

Don’t repeat the same camera movement for 5 consecutive shots.

If your last scene was:

- a slow push-in

Make the next one:

- a side tracking shot
- or a subtle orbit
