Avoiding Overanimation

Kling is powerful.

But it’s not magic.

If you overload it with too much movement or overly complex instructions, it will often:

- blur the animation
- distort character details
- create unnatural motion
- lose visual sharpness

This usually happens when the prompt contains:

- too many simultaneous actions
- extremely fast movement
- chaotic camera directions
- excessive environmental effects

More motion does not mean better animation.

Keep It Simple

The most stable and cinematic results usually come from simple structure:

- Camera motion
- Character motion
- (Optional) One additional effect

That’s it.

Example:

- Slow cinematic push-in
- Skeleton slowly turning head
- Subtle dust moving in background

Why Overanimation Is Dangerous

Long, complicated prompts increase the chance that Kling:

- misinterprets instructions
- prioritizes the wrong movement
- breaks facial consistency
- produces low-quality blur

And remember:

Kling is expensive.
Credits go fast.

The cleaner your prompt, the fewer regenerations you'll need.

Which saves money.

Golden Rule

If the animation feels:

- chaotic
- blurry
- unnatural

Your prompt is probably too complex.

Simplify it.

Cinematic motion is usually subtle.
