Speed Ramp Effect (Quick Acceleration Cut)

A very popular effect used in Skeleton-style videos is the sudden “speed-up” (speed ramp) effect. You can often see it on larger channels like Dr Data etc.

The good news is - it’s extremely simple to create.

I’ve attached a video example in case you want to see it step by step, but here’s the full breakdown.

Before you start, make sure your clip is slightly longer than your voiceover.
For example, if your voiceover lasts 3 seconds, it’s best if your clip is around 5 seconds long. This gives you enough space to apply the effect smoothly.

I’ll demonstrate this in Premiere Pro, but the exact same method works in CapCut - it’s simply cutting the clip and speeding up the middle section.

Step-by-Step

1. **Choose the clip** you want to apply the effect to.
2. **Cut the clip in two places**, leaving the middle section as the largest part.
   Don’t overthink this - you can adjust it by eye until it looks right.
   - Premiere Pro: `Ctrl + K`
   - CapCut: `Ctrl + B`
3. **Select the middle section** and increase its speed to around **200–400%**.
   (I usually use around 300%, but feel free to experiment)
4. After speeding it up, the clip will become shorter on the timeline.
   Drag the remaining parts together so they connect again.
5. Play it back and adjust if needed - that’s it.

When This Effect Works Best

This effect doesn’t work equally well on every clip, so it’s important to choose the right type of footage.

It works best on clips with **forward motion or zoom-in movement**.

You can achieve this in two ways:

Option 1 - Inside Kling (recommended):
Simply include in your prompt:
“camera zoom in”

Option 2 - In editing (keyframes):

- At the start of the clip → set scale to **100%**
- At the end of the clip → increase scale to around **110%**

This creates a subtle zoom-in effect that pairs perfectly with the speed ramp.

Final Tip

Don’t try to force this effect into every clip.

Use it selectively - only when it actually improves the pacing and energy of the scene.

When used correctly, it adds a strong sense of motion and keeps the viewer engaged without overcomplicating your editing.
