Text Placement & Fonts

Captions are essential in short-form content.

Even if you have a strong voiceover, a large percentage of viewers:

- watch without sound
- scroll fast
- need visual reinforcement

So we always add subtitles.

How to Generate Captions

Both Premiere Pro and CapCut allow automatic caption generation.

In:

- **CapCut** → the feature is called *Automatic Captions*
- **Premiere Pro** → the feature is called *Captions*

Import your voiceover first, then generate captions automatically from the audio.

After generation, you can customize:

- Font
- Size
- Position
- Stroke
- Animation
- Color

My Personal Caption Settings

If you need a starting point, here are mine:

- **Font:** Helvetica Neue
- **Black stroke** (for readability)

- **Caption animation:** “Pop Up” / “Bounce” style
- **Bold effect enabled**

“Day” / “Hour” Text

In addition to script subtitles, I also generate separate text for:

- Day 1
- Day 2
- Hour 12
- Year 3

These appear only when they are mentioned in the voiceover.

For these, I use a different font:

Fredoka

This helps visually separate timeline markers from the main narration.

Watermark (Optional)

You can also add your watermark.

But from experience:

If someone wants to steal your video, they will remove it anyway.

So don’t overthink it.

If you use one:

- Reduce opacity
- Place it subtly under subtitles
- Keep it small and non-intrusive

What Actually Matters

Fonts and styling do not make a video viral.

The only real requirements are:

- Clean

- Readable
- Not distracting
