Sound Design

Sound design in this niche is simple.

Either:

- You generated native audio in Kling/Veo
  or
- You didn't.

If you already have generated audio - great.
Just balance it properly with the voiceover.

If not, you can easily add sound manually.

Adding Natural Sound Effects

If your scene includes something obvious (for example):

- The ocean → add sea ambience
- Fire → subtle fire crackling
- Marketplace → light crowd ambience
- Wind → soft wind sound

You can download natural sound effects from:

- https://www.myinstants.com/en/index/us/
- YouTube (often better for more natural ambience loops)

Keep it subtle.

These effects are background atmosphere - not the main focus.

My Structure for Effects

Here's exactly how I use sound effects:

1️⃣ At the very start (during the hook),
I add a strong impact sound when the image changes.

2️⃣ When the timeline changes (e.g. Day 1 → Day 2 → Day 3),
I add a different transition sound.

3️⃣ When there’s a zoom-in or dramatic shift,
I add a **“swoosh”** sound.

That’s it.

Ready-Made Pack

All the sound effects and background music I personally use are included in the Google Drive folder:

https://drive.google.com/drive/folders/1txJHWCoomAI79gRY6vfFFaV3RgDehgu4?usp=sharing

You don’t need to search for anything.

They’re ready to download and use.

If you prefer to find your own sounds, use the websites mentioned above.

Volume Balance (Very Important)

Sound effects and music must never overpower the voiceover.

Voiceover is always priority.

For music, I usually set it around:

–11 dB

Then adjust slightly depending on the voice level.

You can listen with headphones before exporting.

If the music distracts from the narration, it’s too loud.
