Channel Creation

In this chapter, we're going to talk about setting up your channels the right way.

We'll focus on three platforms:

- YouTube
- TikTok
- Facebook

The main attention will go to YouTube and TikTok. They're the easiest to monetize, they scale fast and they're the platforms where I have the most real-world experience.

That said, Facebook is still worth talking about. Reuploading there can create an additional revenue stream with almost no extra work once your system is built. We'll cover monetization basics for all three.

Does Channel Setup Actually Matter?

Short answer: yes.

Long answer: it's not magic, BUT it reduces risk.

There are two camps online:

1. "Warming up a channel is important"
2. "Warming up is complete bullshit"

From my experience?

It's better to do it.

Not because skipping it guarantees failure. But because skipping it increases unnecessary risk.

When you create a brand-new account and immediately start uploading your videos, there's always a chance the platform flags you as suspicious behavior. Especially on TikTok. Sometimes on YouTube. And if your videos start getting 0 views, you've just wasted time trying to debug something that could've been avoided.

Could you post without warming up and succeed?
Yes.

But I prefer being safe instead of sorry.

You're building a system. The last thing you want is to sabotage yourself at step one because you rushed the setup.

My Position on Warming Up Channels

I personally warm up every new channel before posting the first real video.

Not in an obsessive way. Not for weeks.

But I make sure the account:

- behaves like a real human account
- interacts naturally
- looks legitimate
- has basic setup completed

Each platform has slightly different methods and expectations. We'll break down specific warming-up strategies in the subchapters for YouTube, TikTok and Facebook separately.

If you follow those steps, you reduce the chance of:

- 0-view videos
- shadow-like suppression
- bot detection issues

It's not about gaming the system.
It's about not triggering it.

In the next sections, we'll go platform by platform and cover:

- Account setup
- Optimization basics
- Warm-up process
- And why reuploading across platforms is one of the simplest scaling strategies available

Time saved at the beginning prevents headaches later.

And if you're building multiple channels, this becomes even more important.
